EXCHANGE 4h.p. Zenith-Gradua, complete lamps, etc., fitted discs and long exhaust, for clutch model Indian or similar machine.—Hollis, 27, Brent St., Hendon. 'Phone: 153 Finchley. [6084

FORD-BAICO 20-24-cwt. Lorry, with cab, perfect condition; exchange Morgan or first-class combination.—Westwell, 24, East Av., Garden Village, Levenshulme, Manchester. [X9213

1919 New Imperial Combination, black and gold, unscratched, little used, £20 equipment, value £180, for Sunbeam, Triumph, Norton combination, or 3-wheeler.—Hay Hill House, Bath. [6647

A.C. Sociable, 2-seater, overhauled, sound, 4 lamps, tools, spares, hood, screen, offers; exchange for modern motor cycle, solo, cash adjustment.—Taggard, Devon Cottage, Knipton, Grantham. [5820

EXCHANGE 3½h.p. Humber, 3-speed, late 1919, Lucas lamps, horn, speedometer, Binks, little used, as new, for modern 2¾h.p., or sell £85.—Whitfield, 96a, Kingston Rd., Portsmouth. [7178

THE Newnham Motor Co. will accept your present machine at a fair valuation in part exchange for a new model. Try us before deciding.—223, Hammersmith Rd., W.6. 'Phone: Hammersmith 80. [6244

EASTER Motor Cycles.—All models for delivery before the holidays. Exchanges arranged by post. Descriptions guaranteed.—Newnham Motor Co., 223, Hammersmith Rd., W.6. 'Phone: Hammersmith 80. [6243

LEVIS Popular, new engine, carburetter, brand new tyres, belt, Mahon, spring saddle, electric light, tax paid, all on; exchange for Douglas or Blackburne.—Apply, Torthorwald, Church Rd., Ashtead, Surrey. [6614

BEST Price Allowed for your machine in part payment for later models; we have a large and varied list for you to select from. Write for list.—Homac's, 243, Lower Clapton Rd., N.E. 'Phone: Dalston 2408. [6130

EXCHANGE 1918 Harley-Davidson Combination, lamps, Klaxon, etc., for 1919 Triumph solo or combination, or sell £125.—S. Fortnam, 1, Shakespeare Av., Harlesden, N.W.10. 'Phone: Willesden 3044. [6349

WE Specialise in exchange deals of any description if reasonable. See our advert. Miscellaneous items columns. We require several T.T. machines in exchange for any machines in stock.—Gray and Raynes, Doncaster. [6097

EXCHANGE 1920 O.K. 2¾h.p. 2-stroke, 2-speed, equipped, splendid condition, for 1916-17 2¾h.p. J.A.P. engined machine, New Imperial or Calthorpe preferred, cash adjustment; Kent district.—Write, stating value, Box 2,789, c/o *The Motor Cycle*. [7130

1920 7-9h.p. Indian (latest model, large valves, etc.), tandem sidecar, large number of spares and extras: £180 or near offer, or exchange with cash for 1921 Henderson or Ace combination; can be seen by appointment.—Norris, 395, Oxford Rd., Reading. [4389

EXCHANGE for first-class combination, cash either way, 12-14h.p. 4-seater touring car, 5 detachable wheels, C.A.V. dynamo lighting set, all accessories, all in good order; trial: £205.—Newnham Motor Co., 223, Hammersmith Rd., W.6. 'Phone: Hammersmith 80. [6242

SINGER 10h.p., 2-seater, just been thoroughly overhauled and renainted grey and aluminium, 5 detachable wheels with discs, electric light, etc., very sporty and genuine car; any trial; exchange motor cycle or combination and cash, or sell £250.—F. Warren, Hindon, Wilts. [6399

DOUGLAS Carburetter, 35/-; H.F. baby vulcaniser, £4, new; 10 galls. castor oil, £5; new £40 typewriter, £16; new O.K. lightweight, £43; lady's, £22; 3-speed Triumph, £12; gent's new B.S.A., 3-speed, £14; Turkish bath cabinet, £7, worth £20. Late 2-3-seater wanted.—Miss E. Holland, Eastry, Kent. [6502

REPAIRERS.

ANY

ARMSTRONG or Sturmey-Archer Gears Repaired promptly and efficiently.—County Engineering Co., Hounslow.

ARMSTRONG and Sturmey-Archer Gears.—We are expeditious repairers.—County Engineering Co., Hounslow

ARMSTRONG and Sturmey-Archer Gears Repaired while you wait.—County Engineering Co., Hounslow [0517

FOR Expert J.A.P. Overhauls and all genuine spares, apply, Crow Bros., Guildford. [3703

C. R. FOSTER, of Leeds, is the original cylinder grinding specialist.

£1,000 is the value of the machine and equipment that will grind your cylinder at our works.—Foster of Leeds, 170, Cardigan Rd.

CYLINDER Grinding by Foster of Leeds has no equal. Price, complete with pistoo, from £2.

VALVES, Triumph, J.A.P., and all standard makes, 9/- a pair.—C. R. Foster, 170, Cardigan Rd., Leeds. [0002

REPAIRERS.

SPARE Parts Dept., repairs, replacements, overhauls, etc.

HUMBER Service Depot, Canterbury Rd., Kilburn, N.W.6. 'Phone: Willesden 1298-1299. T.A.: Humberonia, London. [0333

WHITTALL Machinists' Co., contractors to the War Office, for all motor repairs.—Below.

WHITTALL for Welding.—Experts in aluminium, broken parts reliably welded, accurately machined, promptly returned.—Below.

WHITTALL.—Cylinders promptly reground and new complete pistons fitted, 48/6, standard makes; perfection guaranteed; rebushing. Pistons to pattern or sketch.—Whittall Machinists' Co., Whittall St., Birmingham. [0017

ARMSTRONG and Sturmey-Archer Gear Specialists; practically every part in stock.—Below.

GEAR Repaired and returned within the week; enquiries answered return of post.—Below.

MEDIUM Sun Pinions, 10/6; small planets, 2/6; pawl cages, 7/6; cones, 4/-; clutch caps, 7/6; clutch nuts, 3/-.—Below.

MAIN Drivers, £2/2; axles, 35/-; best material used; price list on application.—A. F. Lewis, Charlestown, Weymouth.

LONDON Agent for the above Armstrong gear parts: White, 437, West Green Rd., Harringay, London, N.15. [5000

ENAMELLING and Plating of every description; whole or part machine.—Nortons (below).

PLATING.—Handle-bars, exhaust pipes, etc., replated; high-class finish; prompt service.—Nortons (below).

ENAMELLING, Plating; complete renovations and repairs.—Norton and Co., School Av., Moseley Rd., Birmingham. [4386

FRAMES, wheels, chassis built and repaired.—110, Coventry Rd., Haymills, Birmingham. [X9313

ELECTRICAL Repairs of all descriptions.—11L, Kramer Mews, West Brompton, S.W.6. [9989

TRIUMPH Riders, please note.—I specialise in repairs and parts for this famous single.—Below

STURMEY-ARCHER Gear Boxes, bottom and top stays, chains, sprockets, and back wheels supplied for conversions.—Below.

STURMEY and Armstrong Hub Gears repaired and parts supplied.—Dalby, Baker St., Sparkhill, Birmingham. [7162

WELDING Aluminium Crank Cases, gear boxes, by heads; immediate attention; reasonable prices.—Below.

WELDING Broken Cylinders, flanges, combustion; experts of 11 years' experience.—Below.

CYLINDER Grinding on latest machinery, installed since hostilities ceased; accuracy guaranteed; new pistons fitted.—Sadgrove and Co., 140, Conybere St., Birmingham. [259

HUMBER, Roc 2-speed, 1909-13, overhauled; spares in stock; V.S., Roc 2-speed spares in stock.—Below.

REX-ROC, overhauled, no sliping on high gear, spares, right and left-hand cones, main axles, planets, high and low gears, toggles, ball races, cups, etc.—Below.

CYLINDERS: Triumph 1908-21, Humbers, Premier, Singer, J.A.P.'s, Precision, Peugeot; also cylinders rebored or reground; pistons oversize to fit.—Below.

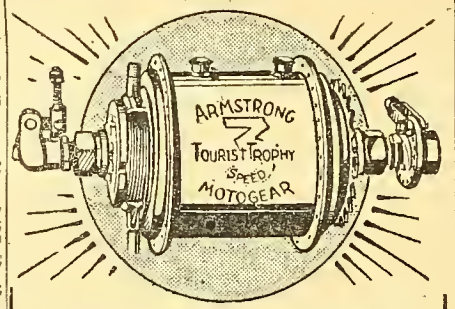
PISTONS Complete, Premier, Triumph, Rover, J.A.P.'s, Douglas, Humber, Rex; Coventry's best productions. Tanks enamelled and painted, Triumph, Rover, Singer, Omega, Rex, P.M., highly finished, work of art.—Below.

J. CONNOLLY, Crown Engineering Works, Vecqueray St., Coventry. Postal: 13, Carmelite Rd., Coventry. [X9254

BRAZING.—Repairs to frames and chassis, any quantity.—T. Skeat, 37, St. George's St., Tyldesley. [5908

PISTONS made to pattern or sketch; cylinder regrinding a speciality.—W. Cole, 63, Sarehole Rd., Sparkhill, Birmingham. [X6636

ARMSTRONG, Sturmey-Archer, and N.S.U. Gears Repaired while you wait, satisfaction guaranteed.—Tavistock (below).



ARMSTRONG Parts, large sun, 7/6; medium suns, 10/-; small suns 5/-; pinions, 2/6; spindles from £1/10 to £1/15.—Tavistock: below.

B.S.A.—Hub gears repaired promptly and efficiently; enquiries solicited.—Tavistock (below).

GEARS.—Any make of gear repaired; parts made to pattern or drawings, quotations free.—Tavistock (below).

GEARS.—Send all gears to Tavistock Engineering Co., 254a, Portobello Rd., Kensington, London. 'Phone: Park 643. [4204

OVERHAULS, repairs, and alterations, gears fitted.—Bright and Hayles, 78, Church St., Camberwell, London. [3798

STURMEY-ARCHER and ARMSTRONG

Gears Repaired Immediately.

In view of the approaching Easter Holidays, we will undertake repair any of the above gears, either Hub or Countershaft, while the messenger waits, and GUARANTEE that when the Gear leaves our works it is in perfect order.

Every part for every type of Armstrong and Sturmey-Archer Motor Cycle Gears actually instock.

Send wheels to Hounslow, L. & S.W. Rly., clearly labelled with sender's name.

Station for callers—HESTON-HOUNSLOW, District Rly.

COUNTY ENGINEERING CO.
64, STAINES ROAD, HOUNSLOW, LONDON, W.

Wires: "Threespeed, Hounslow." 'Phone: Hounslow 822

Delivery for Easter

Any of these undermentioned models can open the joy of the road to you this Easter. I can deliver in full time for the holidays.

My Price Guarantee

assures you the best terms obtainable between now and Whitsuntide. Given with every machine I sell it has already proved itself to early buyers, and holds good for all immediate purchasers. Read the letter reproduced—and then the guarantee.

5, Leopold St, Sheffield.

Many thanks for your letter of yesterday, enclosing cheque for £10, pursuant to your guarantee to me re "Lagonda" car and drop in price. I fully realise that this guarantee was a personal matter between you and me, and I much appreciate the spirit in which you have acted upon it. My car is giving the greatest satisfaction, and is much admired, and I shall certainly do all I can by recommending both car and local agent.

Yours faithfully, T. A. G.

I hereby undertake to refund in hard cash the amount of any drop in retail price of the undermentioned Motor Cycles and Light Cars from to-day's date until Whit-Monday, May 16, 1921, on production of receipt showing price paid to me for same.

A.J.S., Indian, Scott, Wilkin, Bradbury, and Bat-Jap Motor Cycles, also Lagonda Cars.

F. B. ROPER,

166-168, London Rd., SHEFFIELD

Wires: Roper, 2802, Sheffield. *'Phone: 2802.*

REPAIRERS.

CYLINDERS Reground, new pistons fitted c plete; £2/12/6.—Bright and Hayles, 78, Chu St., Camberwell. [3

FRAME, chassis, and tank repairs, enamelling plating, by experts; prompt deliveries.—Langh Co., Fitzroy St., Leicester. [6

PISTONS for all engines up to 60 mm. 20/-, 70 m 22/6, 80 mm. 25/-, 90 mm. 27/6; complete w rings and pin.—Below.

WELDING, scored or broken cylinders, crank ca etc.; nothing too large or small.—Below.

CYLINDER Grinding on latest machinery, up to mm. 45/-, to 85 mm. 52/6; complete with pist 3-5 days delivery.—Below.

VALVES in finest nickel steel, 7/6 each; piston ri or any other parts made.—Kellett and Collin Ltd., Havelock St., Gt. Horton, Bradford. [5

ENGINES Rebushed, overhauled, rings fitted, c pression guaranteed, 40/-, twins 50/-; val chrome nickel, unbreakable, 12/6 pair.—Below.

PISTON Rings, high grade, standard or overs any pattern; return post. 2/- each.—Pat Rings, Wigan Rd., Atherton. [5

ARMSTRONG and Sturmey Gears Repaired, or p supplied promptly.—The Rotary Jointing Cherry Lane Garage, Lymm, Cheshire. [6

TANKS Re-enamelled and Transferred, makers' des 12/6; send your repairs.—Whitworth Motor R vating Co., 90a, Pershore St., Birmingham. [5

PLATING, Enamelling.—Tanks enamelled orig colours; handle-bars, pipes, etc., plated.—Nor and Co., School Av., Moseley Rd., Birmingham. [4

CYLINDERS Reground, fitted with new pist complete from 30/-; 85 mm. 32/-; engines bushed.—Elson, 264, Stoney Stanton Rd., Coventr [X8

CYLINDER Regrinding, oversize pistons, accu work, prompt delivery and keen prices.—Edw Eng. Co., 225, Acton Lane, Chiswick, W.4. 'Pho 1383. [0

SPARE Parts.—Valves, bushes, pistons, and rings, parts made to pattern, complete engine overha —White Bros., 112a, High St., Harlesden, Lond N.W.10. [2

Cycle Car Prices.

RECENT reductions in the prices of certain well-known cycle cars—both of the four and three-wheeled varieties—have rendered such vehicles in direct price competition with the highest priced sidecar outfits. It has always been said that the motor cyclist prefers to be at the top of one class rather than at the bottom of another; but in the cases we have in mind, the vehicles are of a quality and specification that preclude the manufacturer of the *de luxe* sidecar from sheltering himself behind the enthusiasm of the sidecar owner.

It was the realisation that such a condition of affairs was not far distant that led *The Motor Cycle* to advocate the inclusion of light three and four-wheeled vehicles, whether sidecar or cycle car, in A.C.U. competitions. That policy, as is generally known, was adopted, and this year's trials, commencing with the Spring Trial on April 27th, will see economical motoring vehicles competing together on level terms.

We do not infer that the position of the average sidecar is assailed, but three and four-wheeled runabouts must score to a certain extent over sidecars of the same price, and having the same general specification and equipment. As to whether this will eventually bring about a reduction in price of the *de luxe* sidecars or the introduction of runabouts to take their place is a moot point. At the present time manufacturing conditions and the stocks held by the majority of firms make both price reductions and new ventures very difficult, and it must also be remembered that many present-day prices are not based on actual costs. Even before the war with stabilised costs of materials, all attempts to produce efficient runabouts at prices near to those of the best sidecars ended in financial loss. At the present time, however, the fully equipped sidecar has been so developed that its cost has gone up in greater proportion, while the runabout proposition has been simplified from a manufacturing standpoint.

An Anomalous Position.

WHEN the new taxation regulations came into force motor cyclists consoled themselves with the thought that, at any rate, the vexed question as to what is or is not a "car" within the meaning of the law was finally decided. That this is not so will be seen on reference to the recently issued "Orders," of which a brief review is given on page 376.

Evidently the Ministry of Transport decided that the weight of 8 cwt. should provide the marking line between motor cycles and three-wheelers as such and cars, but under the existing Motor Car Act of 1903, the three-wheeled machines (presumably including sidecar outfits) over 3 cwt. must be registered as cars, must carry car size number plates, and must have the rear number plate illuminated. Was ever so Gilbertian a situation conceived, wherein a machine licensed as a motor cycle under one set of laws should be infringing another set?

Surely our legislators, in conference with representatives of the motor cycle trade and public, can arrive at a decision to amend the obsolete Act, and agree that all machines taxed as motor cycles, *i.e.*, under 8 cwt., shall be uniformly registered, numbered, and lighted.

The Call of the Road.

BY the time these lines are printed competitors in the many Easter events will be busy adding final touches to their mounts. Hundreds of other motor cyclists will be on the point of starting for their holiday jaunts, either on new machines or on faithful friends revived for the occasion. A touch of sunshine and a hint of spring in the air will be sufficient to produce even the army of hardy old crocks the activities of which are generally curtailed in winter time. May we add our best wishes for fine weather and good roads, and may these blessings particularly attend "long-distance" competitors?

An Index to the advertisements in this issue will be found on page Supplement liv.

OCCASIONAL COMMENTS

BY "IXION"

Back to Belts.

AS I am riding a belt-driver, and am temporarily divorced from all my cans of patent grease remover, the inside of both my hands is now coloured that rich, subfusc slatey-black colour which only belt users know How it brought back ancient days! The 'bus, like the prophet's axe, was borrowed. When the belt mistook its pulley for a ball bearing on a steep hill in the rain, I was quite ignorant what tools I had aboard. Joy! There *was* a belt punch! Then came the old thrill of removing a rusty $\frac{3}{16}$in. nut with an 8in. King Dick, slightly gapey at the jaws. Next the hard slogging of driving the belt drill through canvas tougher than steel tape, and seeing that the hole kept central, since the punches (as of yore) didn't fit. Presently the handle came adrift from the drill—handles always do, light riveting being the popular method of attachment. History once more repeated itself, and the drill was coaxed home with gas pliers. Then the belt was slowly sawn through with an ancient knife, blunted by much decarbonisation of tobacco pipes. Finally the new hole in the belt had to be sought with a microscope, as the compressible rubber had expanded and refilled it. At last, with the aid of two large stones, the fastener bolt is painfully beaten through the hole, not without parlous damage to its thread. A fresh struggle between the 8in. wrench and the $\frac{3}{16}$in. nut—and "Ixion" takes the road again, filthy, blasphemous, but withal, inwardly rejoicing.

And Presently.

YOU cannot all follow the mechanics of the sequel, but a fellow-feeling makes you wondrous kind with the general layout of the incident. A 2½ h.p. engine, steep hills, and a sidecar soon stretched the above mentioned belt another inch or so. I then recalled that the inventor of the patent gear fitted to this particular 'bus had told me I need not bother to cut the belt when it stretched. It was only necessary to unscrew the lock nut outside the pulley, and rotate a sleeve, when, hey presto! the belt would take itself up *ad lib.* (*Ad lib.* = 3in. in this case, to be precise.) Let it be premised that I had completely forgotten his instructions, that I had no book of the words, no notion of how the entrails of the gadget were constructed, and that Jupiter Pluvius was trying to dump rain at the rate of 2in. per hour. Blessing my memory, I unscrewed the lock nut—I was *sure* that was the first step. As the nut came off, I enjoyed a brief fleeting glimpse of the tip of a threaded spindle, which was in the act of retreating into the cavernous bowels of the patent pulley. "Aghast" is, I think, the correct term for my expression at this appalling *contretemps*. Unless I could persuade this spindle to reappear from inside the pulley, I must wait for a cart. On the other hand, if I dared greatly and dismantled the pulley further, should I ever get it together again? I tried to coax the spindle out with a gold toothpick. Nothing doing. I put the gear up and down, took the belt off, put it on again, screwed everything in reach both ways, and, rapture! the spindle popped its tip out again for a fraction of a second. I collared it relentlessly, and as I did so, I realised that the nut had rolled off the footboard, and lay out of my reach. So if any reader was in the car that presently passed, and marvelled to see a distinguished-looking man kneeling beside a motor cycle and gripping part of it with a mute appealing expression on his face, he will now be able to explain the incident.

When I got home, I studied blue prints, and I am now complete master of the actions of that infernal spindle.

"Chuck it in the Hedge."

BY the way, my wife has just handed her weekly grocery order to a youth who calls for it every Thursday on a Douglas, and delivers it every Friday with a Ford. Straws show. These men want to-day—and the whole world will want to-morrow—a machine which can be "chucked in the hedge" during a short business call. At present we pay upwards of £100 for the nuttiest outfit we can discover at Olympia. We keep it on an altar in a temple (stand in a garage), and do poojah to it when it is too dark, or wet, or cold to ride. When the machine gets wet or dirty, we spend up to three hours polishing it, though the ride which caused the threat of permanent injury may not have exceeded ten miles, or even two miles. These devotions are necessary. First, because the machine is so vulnerable to rust; secondly, because we are bound to lose £30 in any case when we sell it, because we sell it after one season, and because we shall lose £50 if we don't take meticulous care of it. At present there are two pet machines for prolonged utility work. One is the "simple single-cylinder" of the most reliable makes; the other is the baby two-stroke of the ditto.

But can we yet say that any machine has been specifically designed for such "chuck it in the hedge" purposes?

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices 20, Tudor Street, E.C.4.

Porlock.

THE "worst hill" controversy is necessarily flavoured by the particular juryman's personal experiences on any given hill. Had I been editorially consulted, I should have plumped for a hill just outside a house where I spent many heavy years. Its surface might be worsened, and I don't suppose the grade was stiffer than 1 in 10. but what with press trial mounts and coming back to my neglected personal 'buses after some journalistic stunt, that hill has taken years off my life. Still, reviewing the various votes, I think I have most sympathy with the men who chose Porlock. I used to live near it, and it still remains my master when it pleases, as it will remain the potential conquerer of any other rider on earth. On a dry day it is the pottiest of climbs for any machine with a low gear. On a wet day it can be the chanciest imaginable climb for a super-expert. No spectator will ever forget the last occasion on which a Six Day travelled that way. Porlock was at its porlockiest—ankle deep in rich, ruddy porridge. We all laughed ourselves into such a state of physical exhaustion that we became powerless to push our dearest pals. The cream of the spectacle was provided by one or two Scotts—machines with ample power and a pluperfect steering. They commenced by ambling up the centre of the road in a beeline, casting surprised, amused, and pitying glances at the machines of lesser design which littered the roadside in every attitude of ridicule and despair. Suddenly the front wheel of the leading Scott ran off the hard stuff, and since no 'bus can steer with a front wheel which for all practical purposes has ceased to exist, the rider waltzed gracefully up a 1 in 2 bank at the edge of the road, and fell back on himself. The following Scott immediately got the wind up; and "wind up" on Porlock in bad weather spells doom. I fancy that over 200 machines essayed the climb during those twenty-four hours; and I am not sure that I dare call any of the few saddled ascents which were made absolutely "clean."

Portable Hand Cleansers.

MY recent comment on this topic has brought letters which show that readers are interested. My one criticism of the product sold as "303" was that it is put up in collapsible tubes. Its makers say they have tried tins, canisters, and boxes, and that a tube is the only feasible outcome. This may be true of "303," which is of a porridgey consistency. But there are cleansers of a more liquid character, which, to my thinking, would meet the case if sold in unsquashable containers. As one who in his time has sat upon a tube of rubber solution when clad in tennis flannels, I hold strong prejudices on the point. A Salop rider recommends a "waterless" cleanser sold in cake form, packed in strong tins, and made by the Boston Blacking Co. He complains that few garages stock it. Most of the other suggestions to hand are vitiated by the fact that water is needed. But I should rather like to hear more of a commodity known as "soap leaves," suitable for carrying in a pocket book.

On the Galibier, in the French Alps. The scenery recompenses one for the trouble of reaching this fine touring ground. (See page 354.)

An 8,600 ft. Climb

Near the foot of the Galibier Pass, south side, looking down the Guisane Valley towards Briancon.

Crossing the Galibier, the Highest Pass in the French Alps, on two Pre-war Machines.

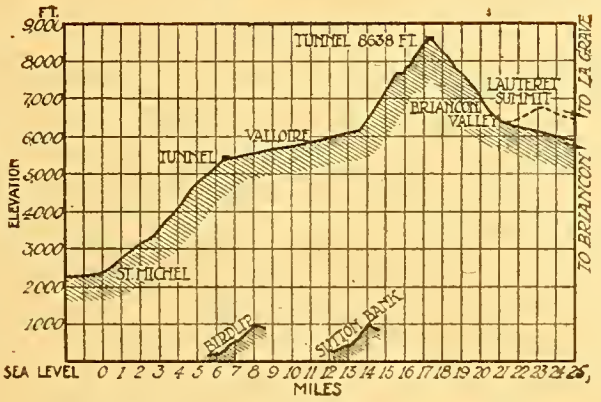
GREAT was our curiosity when my friend and I set out from London last summer with the intention of climbing the biggest hill in France—second only to the Austrian "Stelvio," the highest pass in Europe.

First, however, a word as to the machines. My friend's mount was a 1913 3½ h.p. Lea-Francis, well seasoned in Cumberland, with 15,000 miles to its credit; my own, an old single-geared Matchless, with a 6 h.p. J.A.P. engine, which I had overhauled, adding one or two special "fakes." I knew it to be good for any main road hill in England on a 3½ to 1 gear, and—what was more important—to be docile to a degree, enabling it to be "paddled off."

We crossed to Dieppe and made for Orleans. Coming from a northern port, the great "route nationale" stretches itself across the country and is an invitation to speed. We will pass rapidly over this part of our journey—as our machines in fact did—and will not attempt to describe the charms of our route through Gien, Autun, Mâcon, and Cremieux to Grenoble.

Shortly before reaching this town—at the gateway of the Alps—we had our first view of the snow-capped mountains. We both thought that they did not seem so impressive as our imagination had led us to expect: this is no doubt due to the clearness of the atmosphere and the difficulty of judging distances.

The "Table d'Orientation" on the summit of the Galibier.



At Grenoble we had an opportunity of examining the motor cycles which were taking part in the Alpine Six Days Trial. Several English machines had been entered, and the Triumph, Scott, and A.B.C. machines looked in good fettle.

We bumped out of Grenoble over a very bad road *en route* to the Col du Lauteret. This pass leads to the Briançon Valley and to the Col de Mt. Genèvre,

An 8,600ft. Climb.—

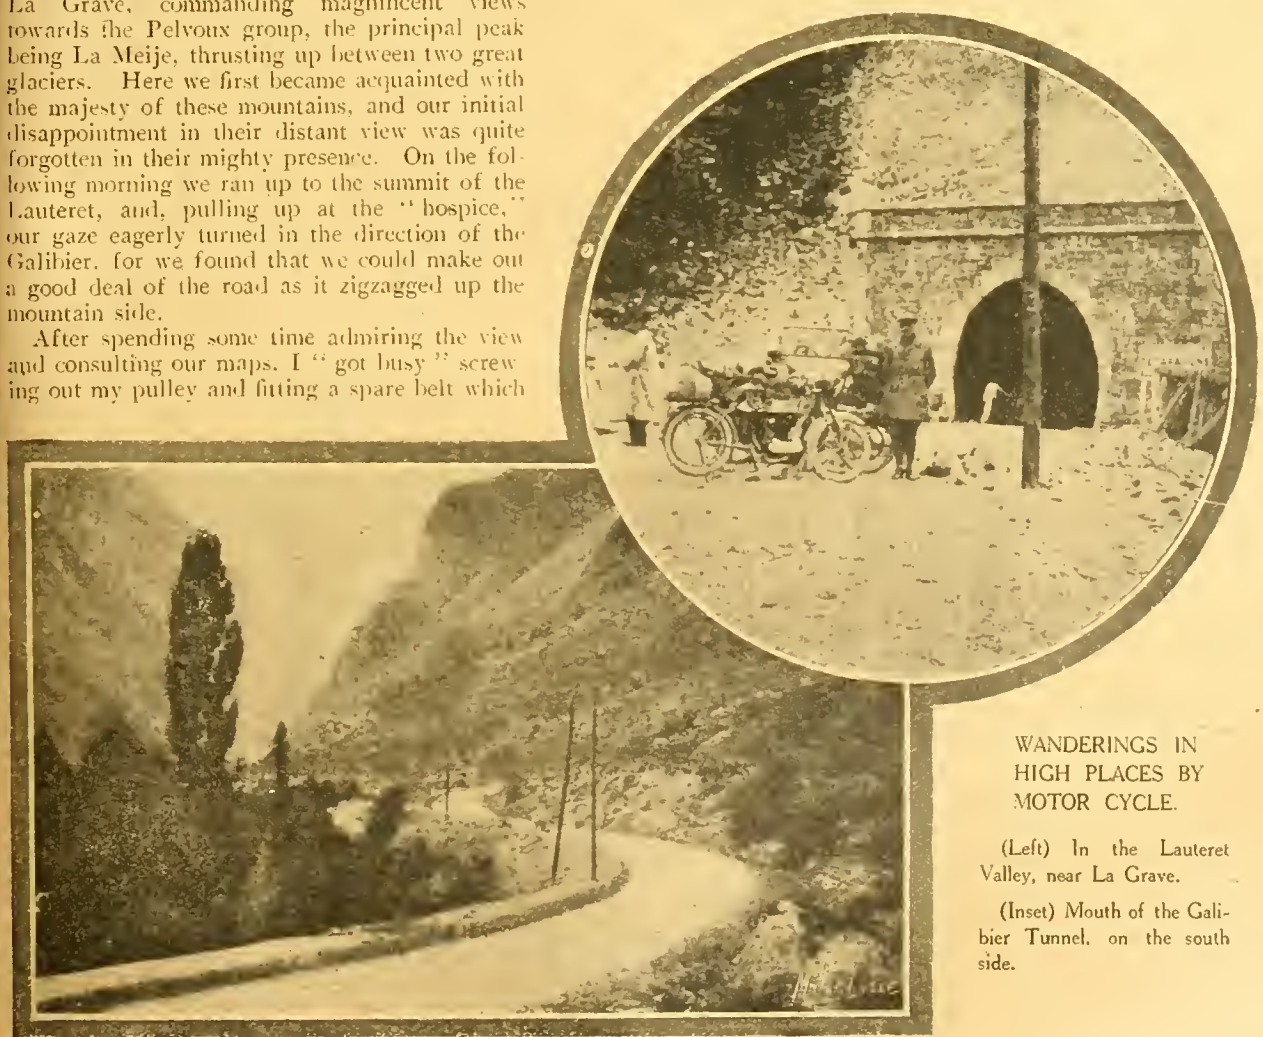
which is one of the great passes leading to Italy, and is thought to be that which Hannibal used when he first crossed the Alps to march on Rome. It is the chief pass in the Southern Alps, the neighbouring pass to the north being the Col du Mt. Cenis.

The Col du Galibier, which we were to explore, lies wholly in France and joins the Lauteret-Mt. Genèvre route with the Mt. Cenis route.

The contours of the Galibier and well-known English hills compared.

From 600ft. to 6,000ft.

Grenoble lies at an elevation of 689ft., and the summit of the Lauteret, at 6,740ft., is fifty-three miles distant. Remembering this, and looking also at the contours of the Galibier and our own famous hills (here reproduced), the reader will be able to form some idea of the nature of the country.



We stayed a night at a charming little place named La Grave, commanding magnificent views towards the Pelvoux group, the principal peak being La Meije, thrusting up between two great glaciers. Here we first became acquainted with the majesty of these mountains, and our initial disappointment in their distant view was quite forgotten in their mighty presence. On the following morning we ran up to the summit of the Lauteret, and, pulling up at the "hospice," our gaze eagerly turned in the direction of the Galibier, for we found that we could make out a good deal of the road as it zigzagged up the mountain side.

After spending some time admiring the view and consulting our maps, I "got busy" screwing out my pulley and fitting a spare belt which lowered the gear to $5\frac{1}{4}$ to 1. This was the first occasion I had done so since leaving Dieppe, and my machine, with its gear at $3\frac{3}{4}$ to 1, had never been in difficulties—surely a testimony to the magnificent grading of these mountain roads.

1 in 8 for Four Miles.

The turning on to the Galibier is about two kilometres below the summit of the Lauteret and at an elevation of 6,260ft.: the Galibier summit is 8,638ft., so that we were faced with a rise of 2,378ft. in a distance of just under four miles, the average gradient being 1 in $8\frac{1}{4}$.

It is a zigzag ascent, including sixteen hairpin turns, many of them being extremely acute. I am, however, recounting what I learnt in that climb; for, knowing none of these things and full of confidence in my

WANDERINGS IN HIGH PLACES BY MOTOR CYCLE.

(Left) In the Lauteret Valley, near La Grave.

(Inset) Mouth of the Galibier Tunnel, on the south side.

A fast piece of road in the Loire Valley. Although it is a national route the surface is partially grass grown.

machine, I swung off the main road and began the climb. I failed to round the first hairpin! My friend on his little two-speeder was soon alongside, and his first remark was, "You'll never do it." I certainly wished my baggage weighed ten and not forty pounds, and that my engine was "clean" instead of carbonised by 1,000 miles of touring, but I knew that I had still some cards to play, so down I went again on to the main road and lowered my gear a shade more: out came the old oil and in went four fresh charges. A fair run was taken at the gradient this time, and I felt that my engine "had the situation in hand." We went nicely round the first corner, a steady pull to the second, round again, the same at the third, but with a strong feeling that there was not much margin!

The Galibier Pass, looking into the Guisane Valley. Observe the sinuous nature of the climb

Conquest!

At the fourth bend I think we were just about on the "limit," but the fifth was easy. Then came several very acute corners in rapid succession, and each one I thought would be the last as the road was narrow and loose and the unguarded edge to a sheer drop took the ginger out of my driving: but we scrambled round, and it was a joy to feel the engine plugging away at about 800 r.p.m. without another sign of faltering.

Higher up was a considerable straight stretch, the spark was forced forward, the air opened up, and away we went—but straight for that precipice again, and, at an acute hairpin, getting into some loose metal, I soon found myself in difficulties and the engine unable to pick up.

The cheery buzzing of the Lea-Francis away below was good to hear, and presently my friend hove in sight. Looking up, we could see the shelter at the summit. After a few minutes' rest, spent in admiring our surroundings, my friend gave me a helping push off. The engine responded at once, the remaining half-dozen hairpins were taken quite comfortably, and we found ourselves on the little plateau in front of the tunnel which carries the road over the pass.

Summer Snow.

Patches of snow lay around us even at this season (end of July). A magnificent view down the Guisane Valley to the south-east and towards the Pelvoux group to the south kept us gazing in admiration for some time before we turned our attention to the passage of the tunnel. This was under repair and a narrow gauge railway track for carrying the material was in use. The far end of the tunnel was boarded up, making the interior very dark, so that we were obliged to push our

An 8,600ft. Climb.—

machines through. The workmen had departed for the mid-day meal, and we had to unfasten the doors at the far end, being greeted on doing so by a Frenchman on a big Renault, who was waiting to enter in the opposite direction. He showed us his maps (French army ones), and he pointed out the principal heights on the chain to the east, on the Italian frontier.

Leaving our machines, we climbed on foot to the saddle above the tunnel. Here a magnificent view in every direction was obtained, and a *table d'orientation* enabled the various mountains to be picked out. We could see Mont Blanc fifty-five miles away to the north and the Cottian Alps thirty-five miles to the south. Below us lay the Valloire Valley, and we could trace our road, as it zigzagged down, until it disappeared around a rocky promontory. It was now past mid-day, and hunger at last drove us to descend to our machines and make tracks for civilisation once more.

Down Again!

The descent to Valloire begins over a wilder piece of country than that on the southern face of the pass. The road winds down with great masses of rock and shale on either hand. Several mountain streams are crossed by wooden bridges which are smashed to pieces each year by the raging torrents which follow the melting of the snows. After passing eight hairpins, the first cottages are met about two miles from the summit; they are little more than huts with low overhanging roofs. Some little boys greeted us with edelweiss, which we accepted as a *porte-bonheur*.

There is a short piece of level ground here, and then a descent of about two miles with seven more hairpin corners carries one down alongside the bed of the river Valloire. Here we saw some snow bridges spanning the torrent. They did not look as if they would carry the weight of a man, and we did not venture ourselves on them.

Little mountain trees now began to appear on either side of our route, and the lower slopes of the hills were again clothed in fir trees, when, after a charming run of seven miles, we entered the village. Seeking bread and cheese, we found a large lunch of soup, meat, and fruit, to which we did justice.

Through the Tunnel.

The road crosses here to the right bank of the stream, and is carried along the hillside at a considerable height above the valley, which becomes narrower where the river plunges into a gorge guarded by a fort. At this point there is a sudden turn in the road and a second tunnel is entered. We had come down from the bare rocky heights into this valley, and were under the impression that the larger part of the descent was already behind us. The view, however, from the further side of the tunnel very soon swept away any such ideas, for, to our amazement, we found ourselves upon a high saddle with steep hillsides covered in trees going down into the valley below, much larger than the one we had left.

Our maps soon enlightened us. We were above the main valley of the Arc, which carries the great main road over the Col Mont Cenis and the railway to the Mont Cenis Tunnel. Our road plunged into the forest and did not emerge until the main valley was reached at St. Michel. The windings of this descent surpassed anything we have previously experienced; turns and hairpin corners followed one another in bewildering succession, until one lost all sense of direction and became intent only on following the windings of the route. The road is narrow and the surface in many places indifferent: there had evidently been "wash-outs" following the melting of the snows, for at one point there was a newly made embankment carrying the road over a now almost dried up torrent bed.

This portion of the descent measures 6½ miles, and there is scarcely a hundred yards stretch of straight road.

Having completed the descent, we were under the impression that it was worse than the southern side, which we had ascended. It seems, however, from a consideration of the gradients, that they are no more severe. I have gone over these very carefully with a map measurer on a large scale ordnance map, and the ascent of the Galibier from the north, although longer than from the south, is probably not much more difficult.

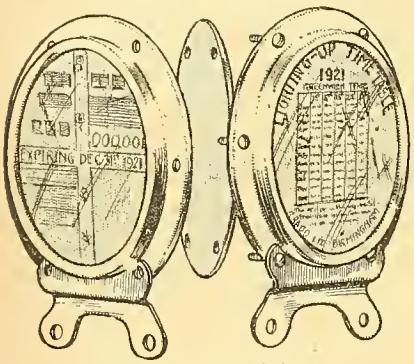
Starting at St. Michel at an elevation of 2,310ft., there is a rise of 3,083ft., extending over 6½ miles, with an average gradient of 1 in 11. The final ascent from the Valloire Valley to the summit, at an elevation of 8,638ft., has an average gradient of almost exactly 1 in 8. It will be seen that the total rise is 6,328ft., a direct lift of more than a mile.

Two Passes.

The Col du Galibier route is not usually opened until the end of June, and each year an immense amount of work is involved, for the road for a great part of its course is cut in very steep hillsides, and the melting of the snows brings down great masses of rock, which, in some places, sweep the road away, and, in others, block it.

Such a pass as this is a very different thing from a great main pass such as the Col de Lauteret, which follows a valley up to its head and so comes naturally and easily to a depression in the watershed. The one follows the line of least resistance—the nature of the country assisting the building of the road—but here, on this pass, the road forces its way across the main direction of the valleys.

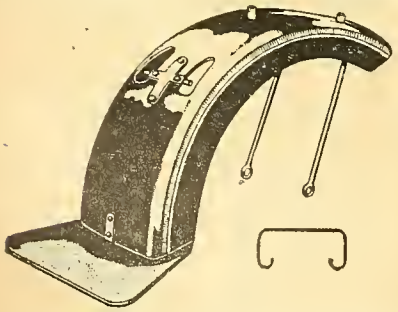
The crossing of this pass is an experience which both of us look forward to repeating, and which we can heartily recommend to every reader of *The Motor Cycle* who is fortunate enough to have the opportunity of visiting the Alps. W.A.D.



A PROMISING DESIGN OF TWENTY YEARS AGO.
The French lightweight Viratelle which had combined engine and gear unit and chain drive in 1902.

Double-sided Licence Holder.

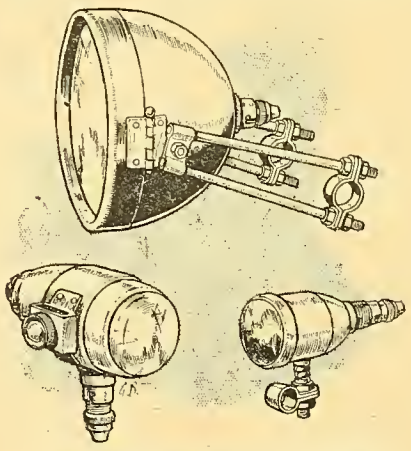
MOTOR cyclists have now become accustomed to the display of licences in holders of various types, and a little thing which is very noticeable with holders fitted on the front number plate is the blank side presented when viewed from the off side of the machine.



The Grado licence holder.

Messrs. Grado, Ltd., Pershore Street, Birmingham, are offering a holder which is intended to accommodate the licence card on one side and a lighting up time table on the other. The article is quite well made, and sells at 7s. 6d.

A Special Front Guard.

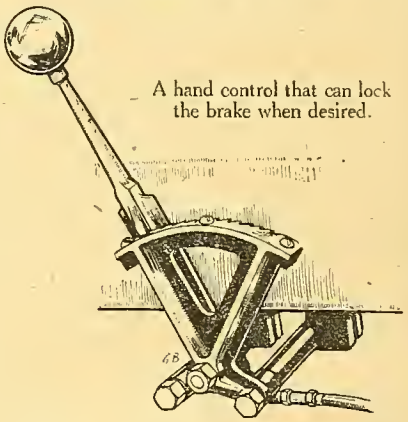


IT is a sign of popularity of a particular machine when firms other than its makers introduce specialities for it. The number of gadgets on the market for the Ford car is an excellent example of this, while in the motor cycle field the fitments now made for Triumph motor cycles are increasing every week. The latest is the special front mudguard introduced by the Bayley Motor Accessories Co., Ltd., Hooper Street, Birmingham, which concern is offering the guard illustrated, complete with all fittings, for 35s. As will be seen, it has water channels, flap, and side valances, in addition to being exceptionally wide.

The Bayley front guard for Triumph motor cycles. Inset shows the channelled section of the guard.

New Electric Lamps.

ELECTRIC lighting for motor cycles is becoming more popular every day, and it is not surprising therefore to find that accessory manufacturers are keeping pace with the times. The lamps illustrated are three of a range of new designs recently introduced by Westwood Rim and Patents Ltd., Lawden Road Foundry, Bordesley, Birmingham. The head lamp, known as the Daybeam, is of 5in. diameter, finished in ebony black, with plated fittings, and is sold for 40s. The sidecar lamp has a 1¾in. convex lens, and sells at 15s., while the tail light is priced at 12s. 6d.

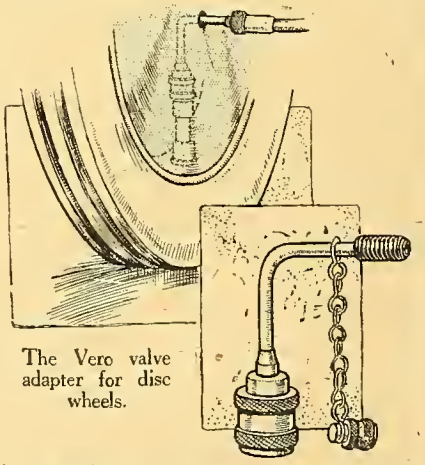


A neat electric lamp set—the "Daybeam."

A Ratchet Brake for Motor Cycles.

VERY few firms have realised that a ratchet control for one of the brakes is just as necessary on a sidecar outfit as on a car. Several times have we been placed in an awkward position through the lack of such a fitment. Almost every motor cyclist at some time or another has had a chain or belt break while ascending a steep hill, or has brought his engine to a standstill and had to restart. On the average machine the rider finds that he dare not leave the saddle until he has backed the machine into a convenient bank, for the reason that it has not been safe to take the foot off the brake pedal.

Now the Engineering Service Co., of Union Street, Ryde, has introduced a ratchet brake which may be fitted to any



A hand control that can lock the brake when desired.

machine, and, of substantial construction, is made to clip on to the tank tube. The price, with 2ft. 6in. of Bowden cable, is 50s.

A Valve Adapter for Disc Wheels.

UNDER the present circumstances it is not an easy matter to inflate the tyre on a wheel fitted with discs, as the pump connection is difficult to screw into position. The adapter illustrated overcomes this difficulty and, having a swivel end, when once screwed on to the valve it can be retained as a permanent fixture, and only a very small hole will be required in the disc. It is made by Arthur R. Price, Ltd., Park Lane, Aston, Birmingham.

The Vero valve adapter for disc wheels.

A Brief Review of the Classic Easter Trial. Timed Section over the Worst Hills of Somerset and Devon—a Searching Test for Low-powered Machines.

AMONG the many Easter events organised by the clubs all over the country, probably the M.C.C. run from London to Land's End is the most important, for the Motor Cycling Club is a national, rather than a local, institution, and its members are scattered all over the country. In such trials as the London-Land's End—and similar events organised by this old club—its members fill up with petrol and turn the three wheel for London, where, at Cranford Bridge, to-morrow evening, the cream of the motor cycle world will congregate to start or to see the start of the long trip to Land's End.

This year no fewer than 216 members will vie with one another for the honour of winning the Jarrott Cup.

An Historic Event.

First held in 1908, the competition has been run annually except for those unfortunate blank years when more serious matters demanded the attention of the nation. As the years passed by, the conditions have been stiffened in order to keep pace with the extraordinary progress made in the power, reliability, and general efficiency of motor cycles, and this year the course has been stiffened by the inclusion of a time limit on the dreaded Porlock Hill, which must be climbed at an average speed of 18 m.p.h. Further, after this three miles timed section, the competitors are required to average 20 m.p.h. until Lynton Hill has been scaled, which means that over the twelve miles taking in Porlock, moorland roads, the descent of Countisbury, and the ascent of Lynton, an average speed of 19.4 m.p.h. has to be maintained. A difficult task, truly, and one which we have criticised on the grounds of safety, and for the reason that it favours the high-powered machines in the competition almost to the exclusion of those with smaller engines.

LONDON-LAND'S END TIME TABLE.

First C'tors Time.	Place.	Inter. Distance	Total Distance.
10.0	Cranford Bridge	—	—
10.10	Maidenhead	13½	13½
11.19	Reading	13	26½
12.10	Newbury	17	43½
12.35	Hungerford	8½	52
1.5	Marlborough	10	62
1.18	Devizes	14½	76½
2.18	Trowbridge	10	86½
2.45	Frome	9	95½
3.19	Shepton Mallet	11½	106½
3.16	Gladstonbury	9	115½
4.30	Bridgwater	14½	130½
6.23	Williton	17½	148
7.5	Porlock	14	162
7.10	Lynmouth	11½	173½
7.42	Lynton Hill Top	½	174
8.33	Barnstaple	17	191
9.1	Bideford	9½	200½
9.56	Holsworthy	18½	218½
10.38	Launceston	14	232½
1.5	Bodmin	21½	254½
2.19	Truro	24½	278½
3.35	Penzance	25½	304
4.5	Land's End	10	314

The following is a list of the previous winners of the coveted trophy:

1908.—F. G. Smith (3½ Triumph).
1910.—The late Admiral Sir R. K. Arbuthnot, Bart., R.N. (3½ Triumph).
1911.—A. J. Moorhouse (7 Indian).
1912.—H. Karslake (3½ Rover).
1913.—P. W. Moffatt (2¾ Douglas).
1919.—E. A. Colliver (7-9 Indian).
1919.—W. H. Elce (10 Morgan).
1920.—T. S. Sharratt (4 Triumph).

Awards to be Gained.

In addition to the premier award, the prizes include the Captain's Cup for the best performance by a sidecar, Elce Cup for three-wheeled cycle cars, Lester Cup for light cars, and gold medals for all who are

1. Not more than 16 mins. early at any point;
2. Not more than 5 mins. late at the bottom of Porlock;
3. Not slower than 18 m.p.h. for the three miles commencing at the Ship Inn at Porlock;
4. Not more than 5 mins. late at the top of Lynton Hill;
5. Not more than 15 mins. late at any other part of the journey.

Silver medals will also be awarded to competitors who are not more than fifteen minutes early or thirty minutes late at any point of the journey.

Below we give a list of the motor cycle and cycle car competitors, who will start at minute intervals. In addition there are sixty-three cars, a list of which is given in to-morrow's *Autocar*.

A Complete List of Solo, Sidecar, and Three-wheeler Entrants.

SOLO MACHINES.

1. T. S. Sharratt (4 Indian Scout).
2. F. A. Longman (3½ Ariel).
3. P. W. Moffat (3½ Douglas).

152. H. W. Holmes (10 Morgan).

Contours of the timed section in the Land's End run.

EASTER WITH THE CLUBS.

A Very Full Week-end: Fixtures North, South, East, and West.

EASTER is a holiday season. Great, therefore, must be the fascination that competitive riding exercises on its devotees to attract so many hundreds of motor cyclists at this season to the most arduous branch of their sport. Granted, that even the London-Land's End Trial possesses much of a holiday nature if the weather gods be favourable; with even slightly adverse conditions the three hundred mile ride between 10 p.m. and 4 p.m. next day will little resemble a holiday as understood by the general public or the dictionary. Difficulties such as Porlock and Lynton (at 18 m.p.h.!) were obviously made to be overcome; and perhaps this is why the classic M.C.C. run has attracted its brave two hundred.

Not Counting the Spectators.

Not the two hundred only are interested in the conquest of Somerset and Devon hills. Several clubs are organising parties to witness the tit-bits of the course, notably the Bournemouth and the Public Schools M.C.C.'s, and lone riders and impromptu parties this year will wend their way westward in increasing numbers to be "in at the death."

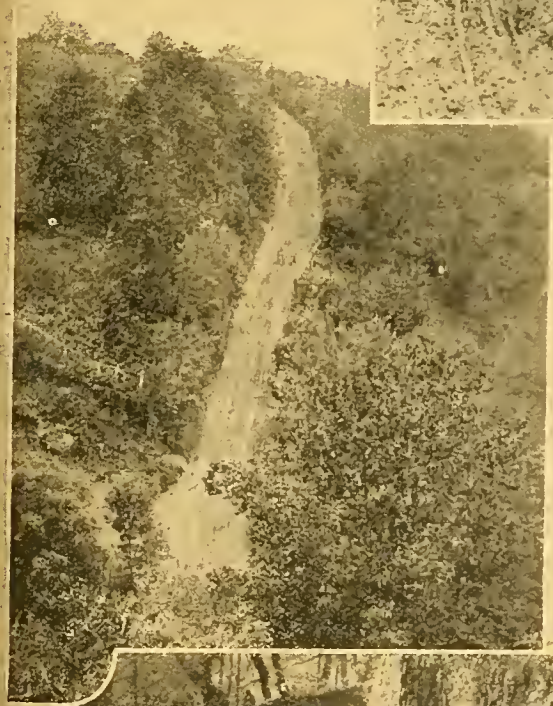
The London-Land's End, despite the huge entry list, has not by any means drawn *all* the competition riders in the country. In the North there is another classic of a different nature, the Richmond Meet, where over thirty Northern clubs will vie for supremacy in the matter of "distances covered multiplied by percentage of paid-up members present." Very simple really; and, given reasonable weather on Good Friday, the old market place at Richmond should be overflowing with enthusiastic riders. Here, again, unattached riders should considerably swell the ranks of those interested.

Also in the North, two days later, there is an inter-club rally at Ribchester, organised by the North-Western Centre A.C.U., on similar lines to the Yorkshire affair. Many important clubs have announced their intention of supporting this meeting, and a big and enthusiastic attendance is expected.

Easter Monday will truly be a busy day, with its one almost "classic" and two open events. Again the Northern rider is lavishly catered for; Westmorland M.C.C. will hold its open hill-climb on Orton Scar (near Kendal), and the Scarborough club is once more organising a climb on Staxton Brow. The latter event is technically "closed," but old associations (this is the eighth year of the Staxton climb) should ensure a heavy entry list nevertheless. Orton Scar, on the other hand, is a genuine open event, and, knowing the excellent organisation that is likely to prevail, we predict a record attendance, and a most enjoyable day's sport with the Westmorland M.C.C. Easter Monday is also the date of the East Midland Centre A.C.U. Open Speed Trials, to be held near Bourne, Lincs. The Lincolnshire M.C.C. has charge of this event, and time and locality should combine to draw a large number of the best known Midland speed men.

Across the Border, the Scottish competition season is opened this year by an important week-end trial, to be promoted by the Glasgow Western M.C.C., March 26th to 28th. The competitors will leave Glasgow shortly after mid-day on Saturday, and journey *via* Crossford, Lanark, and Abbington to Carlisle. On Sunday they will have free access to their machines, this being rather an innovation in competition rules, and the Cumberland County M.C.C. has consented to provide guides to competitors wishing to view their locality. No doubt some of the famous Cumberland hills will be visited. On Monday the route will lie in the Lake District, and will include Kirkstone Pass.

Closed Club Events.



Closed club events there are, innumerable. Some are merely social runs, often with one of the big events as a destination, while others will assume more important proportions. For example, the Carmarthen M.C. and L.C.C. is holding a hill-climb on Good Friday, which is bound to appeal to other Welsh clubs and motor cyclists outside the club's own membership roll. The same thing may be said of the Neath Club's reliability trial. Amongst the other competitive club fixtures for Easter week are hill-climbs at Brighton and at Dewsbury, an acceleration test with the West Kent M.C.C., the Birmingham M.C.C.'s "closed" Sangster Cup Trial, and the North London M.C.C.'s Staley Cup Trial.

M.C.C. LONDON-LAND'S END.

Devonshire Hills that will test Competitors' Riding Ability as well as their Machines.

The upper photograph, which depicts the second bend on Porlock, conveys some idea of what competitors will have to face in the way of road surface at this awkward bend should the weather be wet.

Centre (left): This appalling-looking gradient confronts one immediately after rounding the first bend of Porlock.

Centre (right): On Countisbury. Lynton can be seen in the distance well above the sea level. Lynmouth is situated in the little cove observable in the photograph.

Bottom: Lynton, a much shorter hill than Porlock, has a very bad hairpin bend and poor surface, with a maximum gradient of 1 in 4.

ROAD TESTS of NEW MODELS

The 1¼ h.p. KENILWORTH MINIATURE.

ALMOST every sober-minded person who thinks of investing in a mechanically-propelled vehicle makes a statement to the effect that ten to fifteen miles per hour represent his maximum requirements. 20 m.p.h. appears to be a high speed to this class of possible buyer, and with knowledge of what can be done with a bicycle, he has in mind similar speeds, but without the necessity for pedalling.

No doubt there is a large available market for a machine to fulfil these requirements; the great interest displayed in the scooter, in its "newspaper" stage, proves this. *The Motor Cycle* prophesied that the scooter would die, and that from its ashes would arise the miniature motor cycle, following the scooter in general dimensions, but provided with a seat.

We tried them all—and most of them we found wanting. Two or three, however, proved quite roadworthy for the purpose for which they were designed. Unfortunately, the scooter earned for itself a bad reputation just as the early cycle cars prejudiced the public against the propositions which were worthy of consideration, and, at the present time, any motor cycle of the size of a scooter is looked upon with a certain amount of suspicion.

Knowing that this type of vehicle has a place in the world of wheels, we recently took over a Kenilworth miniature for a couple of weeks' test, and found that it had certain advantages of its own which should appeal to everyone who prefers to travel in ease on his journeys between home and office, or, in the case of a lady, to the shops or on social calls.

Changing as we did straight from an exceptionally fast single and, earlier, a big twin, we confess to a feeling that, at first, the Kenilworth seemed a toy. Its weight was lower than any motor cycle we had tried for many years. With the 18in. wheels, its seventy

SPECIFICATION.

ENGINE: 1¼ *h.p. Norman,* 55 × 60 *mm.* (142.5 *c.c.*) *four-stroke single overhead valves.*
LUBRICATION: Hand pump. *MAGNETO: Runbaken.*
CARBURETTER: Vici single lever, with pilot jet.
TRANSMISSION: Whittle belt to countershaft; ½*in. chain to rear wheel.*
BRAKES: Toe-operated rear band brake. Hand-operated stirrup on front wheel. *WHEELS:* 18 × 2*in.*
WEIGHT: 75 *lb.* *PRICE: £52 10s.*

In the case of a puncture and aversion to mending it on the road, it is possible to walk alongside the Kenilworth and allow it to propel itself

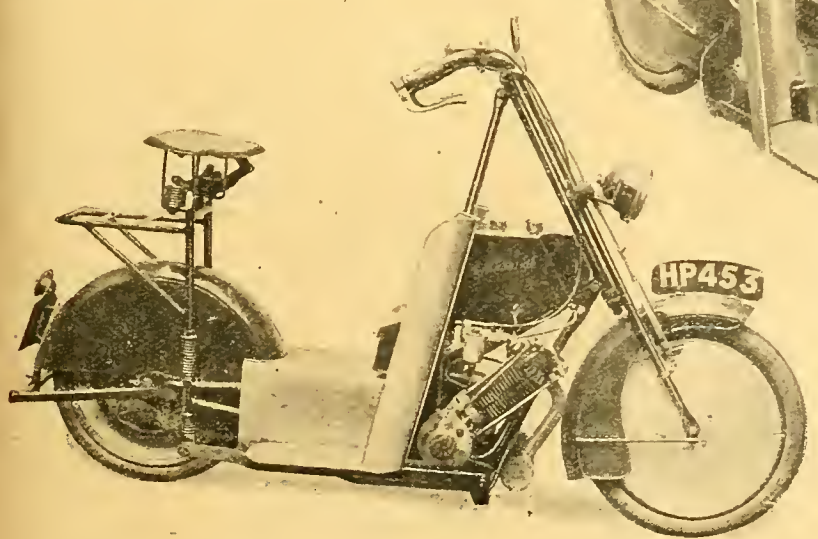
Road Tests of New Models.—

odd pounds is placed so low that we were not reminded of the days when diminutive engines were placed high in the frame. The weight is well distributed also, and the machine wheels easily. We have tried lighter scooters which could not be wheeled comfortably and which, when the engine refused to fire, had a disconcerting way of "kicking up their heels," swinging round and striking one on the calf. There is not the slightest tendency for the little Kenilworth to perform such antics: quite soberly it wheels along until, with the throttle lever about ¼in. open, one drops the exhaust lifter. Then at walking speed the miniature four-stroke engine fires, but there is no rapid acceleration as with a motor cycle. In fact, its docility permits one to walk alongside, holding one of the handle-bars and allowing the engine to propel the machine.

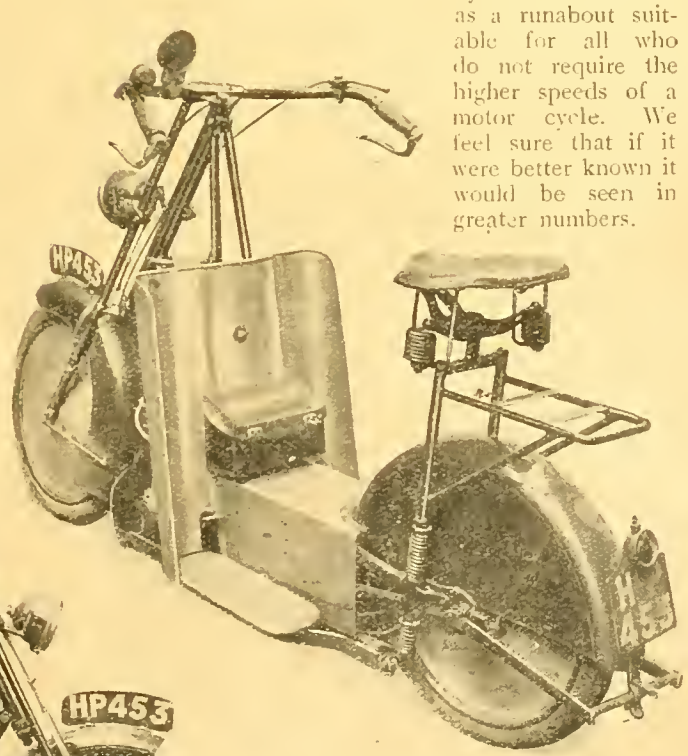
Remarkable Controllability.

We discovered this characteristic of the Kenilworth one morning when, half a mile from the office, the rear tyre suddenly went flat. With the flywheel just turning over we allowed it to take the machine to our destination, while we walked alongside on the pavement, guiding it by one of the bars, just as one would a pedal cycle.

As regards its speed, apparently about 15 m.p.h. can be maintained indefinitely, but the engine is capable of considerably exceeding this rate of speed—in fact, we have driven it as fast as 25 m.p.h., but our mechanical susceptibilities were reproached by the high revving engine, although, even at its highest speeds, there is even less vibration than with many larger engines. This, of course, is due to its small size, coupled with good balance and light moving parts. Of mechanical sounds there are few at ordinary speeds, and the burble of the exhaust is not unpleasant even to those unaccustomed to motor cycles.



With such small wheels, the motor cyclist immediately questions its comfort on the road. Whether it is due to its short wheelbase or to its excellent springing arrangement by which the saddle pillar and footboards are made to move together, it would surprise the average rider in this respect. We frequently covered a pot-holey section which, with either solo or sidecar, compels one to "go easy," on the Kenilworth, no discomfort being experienced, for there was little tendency for the machine to bounce.



Simplicity of Control.

The simplicity of its control (exhaust lifter and single lever Vici carburetter for the engine; hand and toe operated brakes for the wheels) renders it an excellent little mount for those who hesitate on the score of complication. In this respect we have been amused by the manner in which elderly people and ladies have mounted the Kenilworth after two minutes' explanation regarding the functions of the three controls. No doubt its small size and *concealed mechanism* inspires confidence to the uninitiated.

Although single-geared its hill-climbing capabilities are quite good. Stoneleigh Hill (a short rise with a maximum gradient of 1 in 9, which the average 2¼-2½ h.p. lightweight just breasts on top gear) was climbed without assistance; naturally a 6 to 1 ratio with 18in. wheels is actually equivalent to a 9 to 1 gear on 28in. wheels.

Altogether we have been very favourably impressed by the Kenilworth as a runabout suitable for all who do not require the higher speeds of a motor cycle. We feel sure that if it were better known it would be seen in greater numbers.

SIDE AND REAR VIEWS OF THE KENILWORTH MINIATURE.

In this machine, mudguarding and concealment of the mechanical elements of the machine have been closely studied and well executed.

COMBINED LIGHTING & IGNITION

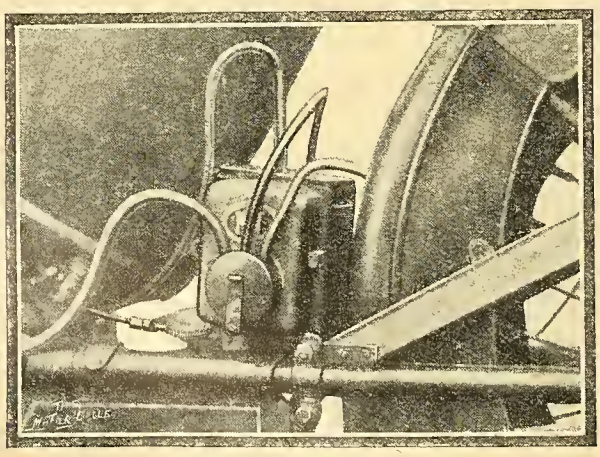
Some Experiences with the M-L Maglita Outfit on a Two-cylinder Two-stroke.

A FEW months ago a member of *The Motor Cycle* staff, who had hitherto relied upon acetylene lighting, decided that the time was ripe for the adoption of complete electrification for his machine.

The decision was arrived at largely as a result of test runs on other machines so equipped; for undoubtedly the strong point of electric lighting is the confident and slightly self-satisfied feeling which arises from the knowledge that, as the shades of evening draw in, the touch of a switch will flood the road with light, without the necessity of stopping and struggling with matches, lamp doors, water valves, and smells.

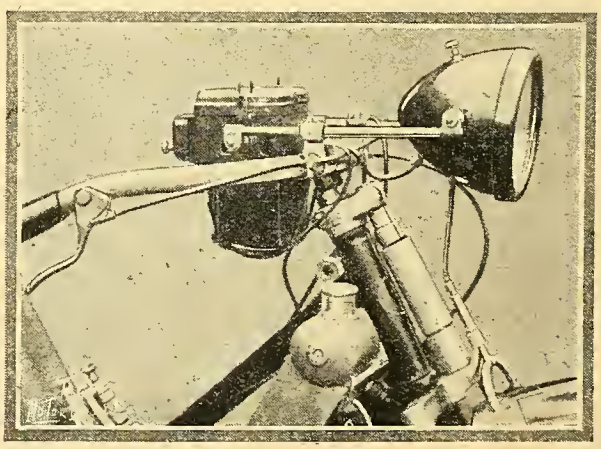
As the machine to be fitted was a Scott, which, being chiefly used with sidecar, has little reserve of power when climbing freak gradients, some fear was entertained of the absorption of b.h.p. in driving a dynamo; in consequence, the claims of the M-L Maglita outfit were considered.

The generator itself consists of an H section armature running between the poles of a pair of permanent magnets; low and high-tension windings are wound upon the upper pole shoe, and the H armature acts as the rotor of a polar inductor magneto. A winding, however, is carried by the rotor, and this generates the charging current, which is rectified through a commutator, and so passes to the battery.



It will be seen that the one rotating armature will require no more power to drive than that absorbed by a magneto, and in consequence it made a strong appeal; moreover, to a mind not brought up on ohms and watts, it seemed less distinctly "electrical" than the average thorough-going dynamo.

No particular difficulty was found in fitting the generator to the machine, but as it was delayed until the eve of the London-Exeter run, hurried work resulted in the driving chain line being incorrect. In consequence, a thirty-mile run on Christmas Eve resulted in the chain jumping off several times, and Christmas Day was spent in a hectic refitting of the whole equipment.



A Severe All-night Test.

The first day's run with the Maglita equipment was from Coventry to Andover, the battery being on charge all the time; then the London-Exeter competitors were picked up, and the lights were in continuous use all the night until daybreak came. For an initial test, through pouring rain, the lights functioned perfectly, although it was noticed that the battery showed a slight tendency to run down; this was no doubt due to the abnormal conditions, for owing to stops while making observations, the battery was not being charged of course.

On the ignition side the machine gave no trouble, despite the fact that special double pole plugs were

Distributer end of the M-L Maglita ignition and lighting generator; it is very little larger than most magnetos

The handsome head lamp has a minimum of projecting nuts and screws. The battery occupies the position usually held by the generator.

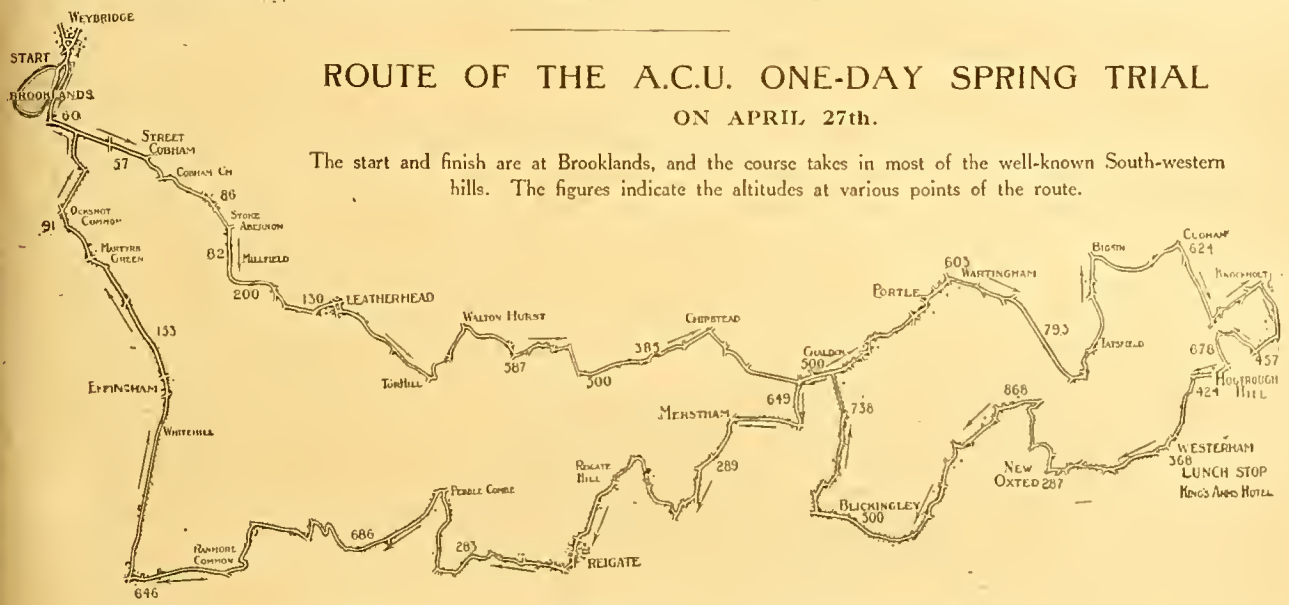
Combined Lighting and Ignition—

being used, which place a greater demand upon the magneto.

These results have been confirmed in subsequent usage. Although the light is not so great as that obtained with separate dynamo equipments, it is quite sufficient for all ordinary purposes.

When a sidecar is fitted a 4 volt 2 ampère bulb is used in the head lamp, and the side and tail lamps carry 4 volt 0.5 ampère bulbs; the battery when fully charged will supply these for about five hours.

Only a minimum amount of attention is called for; the generator requires no lubrication, and appears to be entirely reliable. The lamps are staunchly made, and have not needed to be touched—incidentally, the bulb holders of the side and tail lamps are a push fit, so that they may be used as inspection lamps. Shortly after taking over the set we drilled a ¼in. hole in the body of the rear lamp, so that a spot of white light was directed on to the ground about three feet to the off side of the machine and level with the back hub. This acts as a tell-tale, and saves looking right round, or perhaps stopping, to see if the rear lamp is in operation.



Up to the present the battery has needed no more attention than an occasional inspection and filling up of the acid with distilled water.

In every way the set has justified the hopes which led to its selection, and has made still another convert to electric lighting.

ROUTE OF THE A.C.U. ONE-DAY SPRING TRIAL

ON APRIL 27th.

The start and finish are at Brooklands, and the course takes in most of the well-known South-western hills. The figures indicate the altitudes at various points of the route.

1921 T.T. REGULATIONS.

Abridged Particulars of the Rules governing both Races. No Important Changes.

NO important change whatsoever is discernible in this year's T.T. regulations. At the same time the salient features are worthy of recapitulation.

One lap of the course is thirty-seven miles four furlongs; the Senior Race (six laps) is, therefore, 225 miles, the Junior Race (five laps) being 187 miles four furlongs.

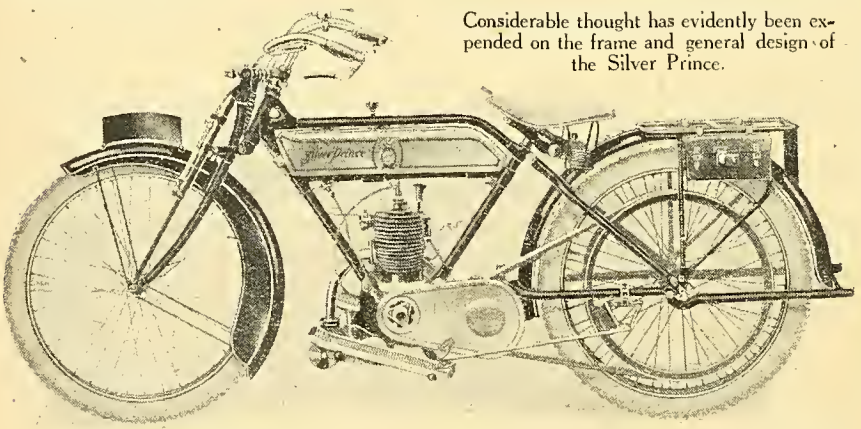
Every competitor must be on the Competitors' Register either of the A.C.U., of the Scottish Auto-Cycle Union, of the Motor Cycle Union of Ireland, of any colonial club recognised by the Union, or of any club in the F.I.C.M.

Motor cycles entered for either race must be touring motor cycles without pedalling gear, and complying with the international definitions on this matter. Silencers are not compulsory during the race, but must be fitted for practising, and at all other times during which the motor cycle is on the Island.

As announced already, the Junior Race, *i.e.*, for motor cycles not exceeding 350 c.c. engine capacity, will take place on Tuesday, June 14th, and the Senior Race, *i.e.*, for motor cycles not exceeding 500 c.c. engine capacity, on Thursday, June 16th. There is a special 250 c.c. class in the Junior Race.

In addition to the Junior and Senior Trophies and cash prizes for places, there will be team prizes for nominated teams finishing within thirty minutes of the winner's time; and in the case of an exceptionally plucky performance the Nisbet award will be made.

Regarding number plates and distinquishing colours, the same rules as last year also apply; and both during the racing and practising, helmets of an approved type must be worn.



Entrants must complete at least six laps in practice, one of which must be made at the following minimum times: Senior Race, sixty minutes; Junior Race, seventy minutes; and 250 c.c. Class in Junior Race, ninety minutes.

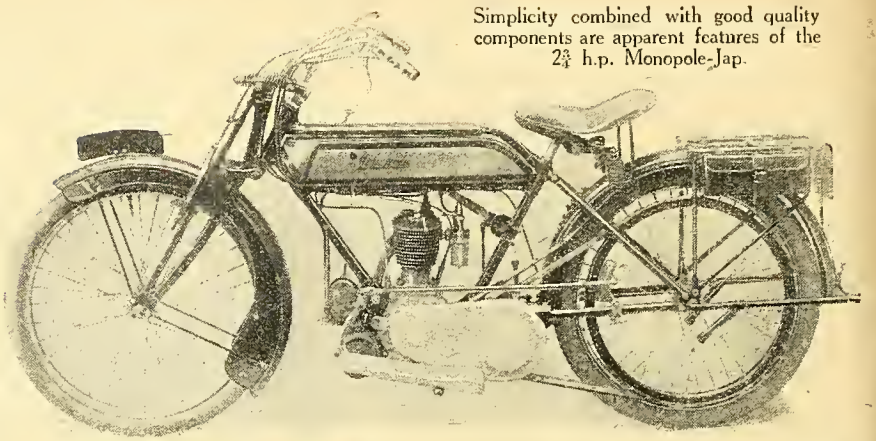
While the remainder of the rules are not of very general interest we advise intending entrants to study them very carefully. Copies may be obtained from the Secretary of the A.C.U., 83, Pall Mall, London, S.W.1. Entries at ordinary fees (£21 per machine) close at noon, Monday, May 2nd, and at double fees at noon, Monday, May 16th. As entries in both races are limited, there seems every possibility that some intending competitors may be disappointed if they do not make very early application.

NEW MODELS AND NAMES.

Many Newcomers to the Motor Cycle Industry. Low Priced Two Strokes receiving Attention. A Lightweight for £46 and a Sidecar Outfit at £80.

DESPITE the present temporary slackness of trade, there is no dearth of new comers to the motor cycle industry, which continues to attract those who desire to enter the manufacturing field. Apparently it is considered an easy trade to enter, since it is possible to obtain the chief units from manufacturers who specialise in them and, to a certain extent, purchasers are thus guaranteed satisfaction. In addition, there are several firms with older reputations re-entering the market.

Considerable thought has evidently been expended on the frame and general design of the Silver Prince.



The Monopole Range.

For example, the Monopole name is one which has long been associated with the cycle industry, and the firm's recently reintroduced motor cycles are in every way up to their previous standard, both in quality and appearance.

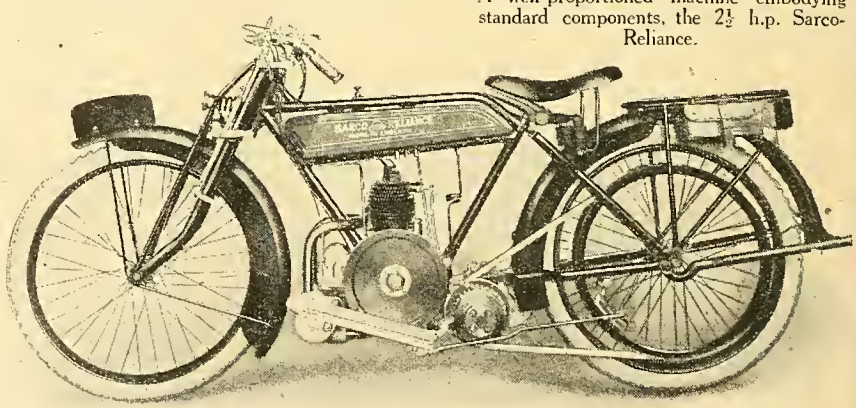
A very complete range of machines is being offered, starting from a Villiers-engined two-stroke single-speed model at 66 guineas to a 5-6 h.p. J.A.P. twin at 136 guineas. In addition to these two extremes there are a two-speed 2¾ h.p. four-stroke with J.A.P. engine and clutch and kick-starter at 85 guineas, a similar model with two-stroke engine at 78 guineas, and a 3½ h.p. Abingdon-engined model with Sturmey-Archer three-speed gear box at 110 guineas.

The machines are exceptionally well made and finished, and although following conventional lines, possess a distinctive appearance with their green enamel. The illustration of the 2¾ h.p. J.A.P. model conveys a good impression of each of the range. It will be seen that a belt guard is extended over the gear box pulley. The Monopole Cycle Co., Ltd., is located at St. Mary's Street, Coventry.

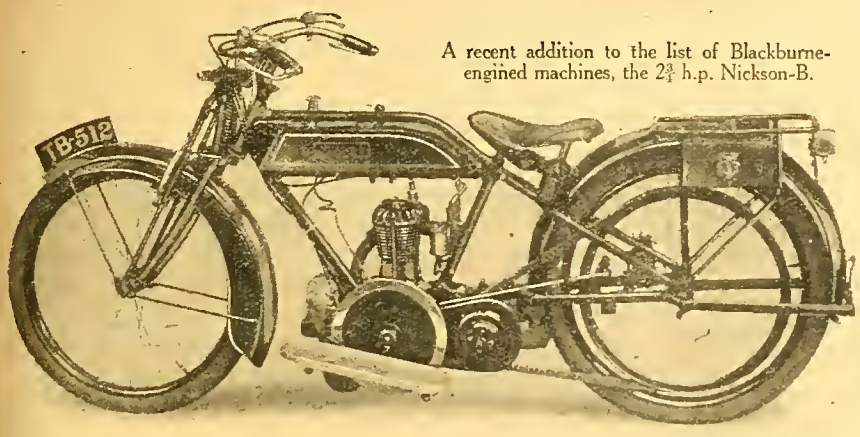
Simplicity combined with good quality components are apparent features of the 2¾ h.p. Monopole-Jap.

A Well-thought-out Lightweight.

Recently we inspected one of the Silver Prince lightweights, which are produced by the Tryus Cycle Co., of Johnstone Street, Birchfields, Birmingham, and were much taken by the general appearance of this new machine and the methods employed to produce it. Usually the smaller makers do not pay a great deal of attention to the question of designing in order to facilitate production—and this applies also to larger firms—but the Tryus company carefully thought out the design before attempting to market the Silver Prince machine. For example, all the tubes used in the back portion of the frame, *i.e.*, the four stays, are identical in their bends. Then the guards are better carried out than on the average low priced motor cycle, the front guard being of 4in., and the rear 5¼in. section.



The tyres are 26×2¼in., while the belt line is the same in both single-speed and two-speed models, which not only facilitates production, but, should the owner of a single-speed model desire a two-speed gear, this can be fitted without structural alteration to the frame.



A Villiers engine is fitted, and the two-speed models have Sturmey-Archer or Albion gears. Brampton forks, Dunlop tyres, and belt rim and inverted lever brakes are included in the equipment. The prices are 46 guineas, single gear; 57 guineas with plain two-speed gear; and 63 guineas with two-speed, clutch, and kick-starter—the weights being 147 lb., 163 lb., and 168 lb. respectively.

Built for Overseas.

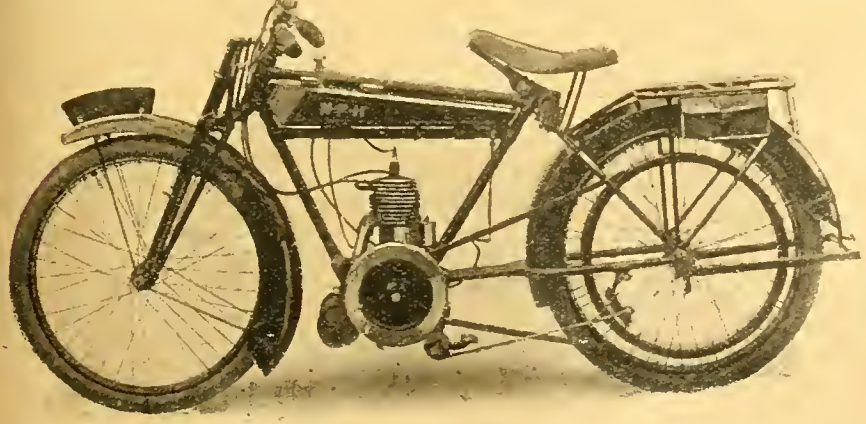
Embodying the large experience of extensive Overseas trade, the Sarco-Reliance has been designed by Messrs. Sanders, Rehders, and Co., Ltd., of 108, Fenchurch Street, London, E.C.3. A 68×72 mm. two-stroke engine having double exhaust pipes, a Burman two-speed gear box with hand-controlled clutch, and a kick-starter are fitted to one model, which retails at £85; a similar machine, but without clutch and starting pedal, is sold for £77 10s. C.A.V. magneto and Saxon forks form part of its good-class equipment: while, in order to render it in every way suitable for hard usage Overseas, the frame is constructed of slightly heavier gauge tubing.

A well-proportioned machine embodying standard components, the 2½ h.p. Sarco-Reliance.

A recent addition to the list of Blackburne-engined machines, the 2¾ h.p. Nickson-B.

A New 4 h.p. Blackburne-engined Mount.

One of the features of the last Olympia Show was the number of machines fitted with 4 h.p. Blackburne engines. Yet another mount has been introduced with this popular power plant—the Nickson, made by John Nickson, 230, Station Road, Bamber Bridge, Lancashire. A Burman three-speed gear box, Brampton forks, and aluminium footplates are included in the equipment, and the saddle height is 29in. The price is £128. Several other models are also made including the J.N.U. 2¾ h.p. two-stroke with a Dalm engine and two-speed gear, with and without clutch and kick starters, at £68 10s. and £75 respectively. Another model has a 2¾ h.p. Blackburne engine, and with two-speed clutch and kick starter sells at £105.

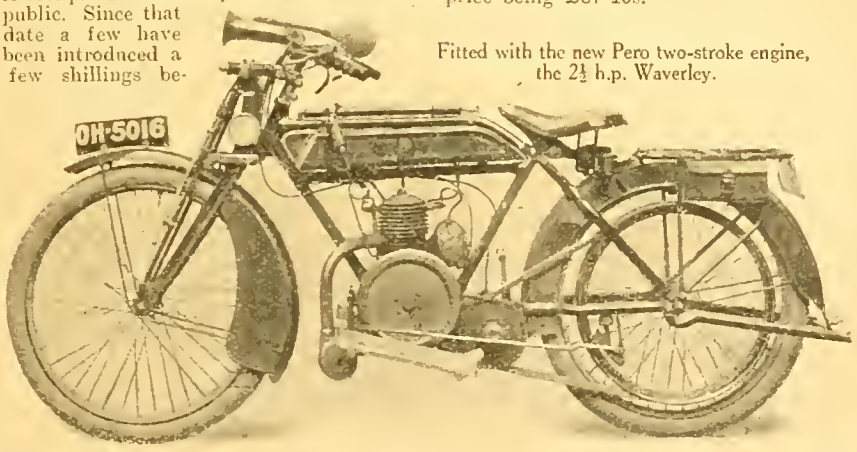


A Pero-engined Lightweight.

The Waverley is another name new to the majority of our readers. It adorns the tanks of a range of motor cycles made by Waverley Motors, of 145, Lichfield Road, Aston, Birmingham. Three models are produced, which are fitted with a Pero two-stroke engine of 269 c.c. capacity. These are single geared, two-speed, and two-speed with clutch and kick-starter, sold at £53, £60, and £65 respectively. The weights vary from 150 lb. to 165 lb. Another model has a 2¾ h.p. Blackburne engine and the equipment usually supplied with such machines. With two-speed gear, clutch, and kick-starter, it sells at £95.

It will be noted that the Pero-engined models have the engine placed high in the frame, and for this reason may be found suitable for certain Overseas markets.

An £80 Sidecar Outfit.

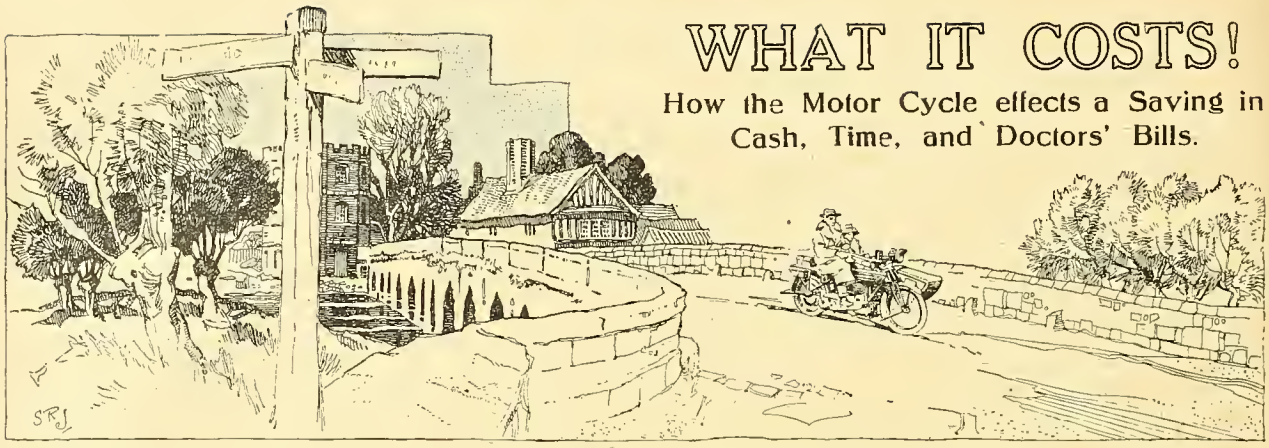


At the last show £49 10s. was the lowest-priced motor cycle offered to the public. Since that date a few have been introduced a few shillings below this amount, and now we are able to illustrate a £46 machine. This is the M.P.H. manufactured by Peter Hay, of 61, Havelock Road, Tyseley, Birmingham, and is engined with 2¾ h.p. Wall two-stroke, equipped with an Amac carburetter and Runbaken magneto. The specification also includes Flexi forks, Lycett pan seat saddle, and 26×2¼ Dunlop tyres. With a two-speed gear the price is £54, while an additional model will shortly be marketed with a 350 c.c. Broler engine, two-speed gear, with clutch and kick-starter, and a light sidecar for £80.

One of the, nowadays, comparatively small class of single-geared lightweights, the 2¼ h.p. M.P.H.

A £47 10s. Lightweight.

Another low-priced lightweight is the Norbreck, made by D. H. Valentine, 40, Gold Street, Wellingborough, who produces an Arden-engined single gear machine at £47 10s. This machine has Arden forks and X.L.-All saddle and rubber covered footrests; on the crossbar of the latter the brake pedal is mounted in a convenient position. There are three other models, of which the £47 10s. type forms the nucleus. One has a plain Burman two-speed gear at £55 10s., another with two-speed clutch and kick-starter at £60, and a third fitted with a three-speed gear of Valentine's own make, which embodies a clutch and kick-starter, and selling at £66. The final model of this range has a 2¾ h.p. Blackburne engine, and a Burman two-speed gear, with clutch and kick-starter, the price being £87 10s.



Fitted with the new Pero two-stroke engine, the 2½ h.p. Waverley.

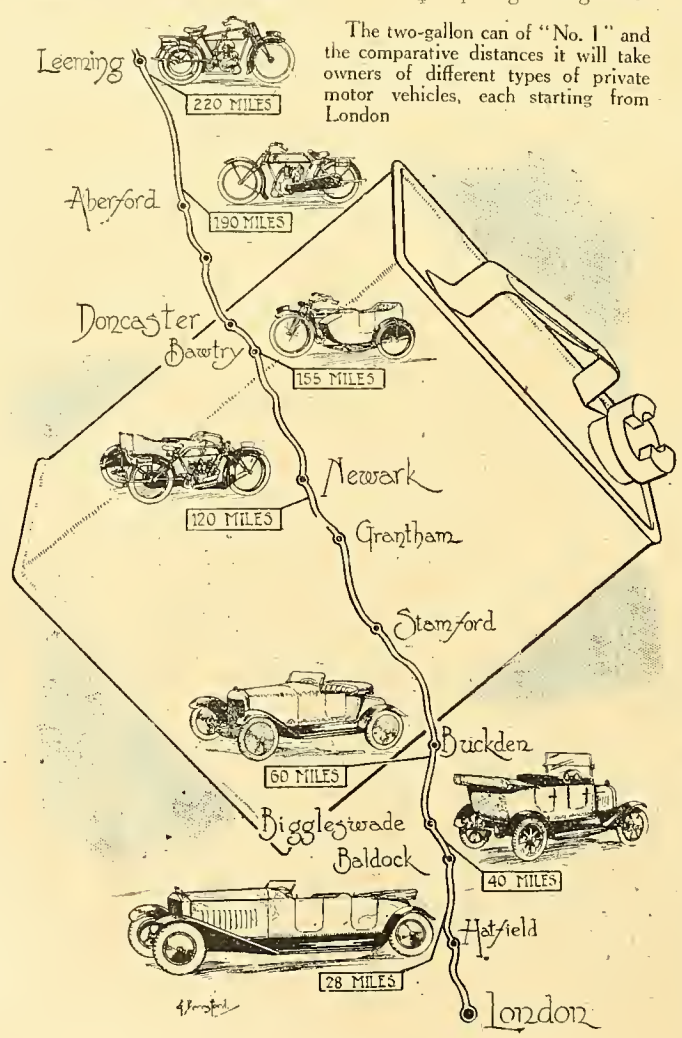
Motor Cycle Championships in France.

THE French Motor Cycle Union has definitely decided to establish two classes of motor cycle championships in France, the Speed Championship and the Touring Championship, open only to competitors of French nationality. The Speed Championships are open to competitors riding motor cycles in the 250 c.c., 350 c.c., and 500 c.c. classes, and to drivers of two-seated cycle cars not exceeding 1,100 c.c. The speed championships this year will be decided in the Grand Prix races on the la Sarthe circuit.

The Touring Championships are open to competitors riding machines in the following classes: Motor cycles 250, 350 and 500 c.c., sidecars 600 and 1,000 c.c., and two-seated cycle cars not exceeding 1,100 c.c. At the beginning of each year the Competitions Committee to the French Motor Cycle Union will name three trials to decide the championships. For the year 1921, the Paris-Nice, the touring trial of the U.M.F., and that of the A.A.A.M.M. have been chosen.

WHAT IT COSTS!

How the Motor Cycle effects a Saving in Cash, Time, and Doctors' Bills.



TWO gallons of petrol cost less than seven shillings, weigh about 16 lb., and can be carried in its familiar coloured tin like a handbag. The same bulk in coal would just about make a fire for toasting or gas enough to boil a kettle; yet the petrol contained in a tin 12in. × 10in. × 5in. is sufficient to transport a motor cyclist—and perhaps a friend on the carrier—a distance of over 200 miles.

If this fact were more generally appreciated there would be even more motor cycles on the road than there are at the present time. Seven and sixpence spent on the railway will take one person 50 miles, two persons 25 miles, and three persons about 17 miles. Three people on a sidecar outfit can travel about 120 miles for this amount, while whole families are regularly transported over long distances at the cost of about four shillings per 60 miles—about half the cost of railway travelling for one person.

Tabulated Costs.

Of course, petrol is not the only cost of motor cycling. Oil costs money also, but it is not enough to add sixpence to every can of petrol used.

So much ink has been spilt on detailed estimates of running costs that it might seem redundant to enlarge upon this aspect of the question. However, one or two other figures are worthy of special notice.

The two-gallon can of "No. 1" and the comparative distances it will take owners of different types of private motor vehicles, each starting from London

As distinct from total expenses (which must include such variable factors as interest on capital, depreciation, licences, and possibly repairs and garage fees), actual running costs, including tyres, should not exceed the following figures per mile (if they do, there is a leakage somewhere):

2¼ h.p. lightweight solo: .8d. per mile.
2⅝ h.p. lightweight solo: 1d. per mile.
3½ h.p. to 4 h.p. solo: 1.15d. per mile.
8 h.p. solo: 1.25d. per mile.
2¾ h.p. sidecar: 1.2d. per mile.
3½ h.p. to 4 h.p. sidecar: 1.5d. per mile.
5 h.p. to 6 h.p. sidecar: 1.75d. per mile.
8 h.p. sidecar: 1.8d. per mile.

The last three types tabulated are often used to transport three persons. Railway fares are 1.75d. per mile per person, and third class travelling at that

Variable Factors.

What we might term the overhead charges (*i.e.*, expenses omitted from the above tables) are often heavy: they are just as often light. Take depreciation. There is a class who always appear able to "buy low and sell high." (The writer positively knows that this is so, for he regularly sells his machines to such people!) Given favourable markets, there is no reason why buying and selling should not be made profitable.

What It Costs.—

Again, take repairs. While one type of rider refuses to mend a simple puncture himself, if at all avoidable, another and quite considerable class take a delight in themselves effecting mechanical repairs of a "super-messy" and finger-nail destroying character. Given a run of trifling bad luck, motor cyclists of the former category may quite justifiably complain that they find motor cycling a much more expensive hobby than they had bargained for. The mechanically inclined, on the other hand, will find themselves little more out of pocket after a month of bad luck involving a succession of trivial repairs than after a week of entirely trouble-free riding. Thus the personal factor is an important variable which cannot be neglected entirely.

There are several further points where the two-wheeler indirectly saves money. Time is money. To most of us the proverb applies with considerable force, and here some surprising economies may be effected. On any cross-country journey the motor cycle scores over the train in average speed; often the saving in time is remarkable. But even where a main-line train service connects two points, the railway's most favourable connections may not necessarily make for the speedier journey. Nor does everybody live within five minutes of a station.

Which brings us to our last point, viz., the benefits of healthy fresh air and, even, stinging rain. Whether used for pleasure or business, the motor cycle is essentially a health-giving vehicle, and, as ill-health is perhaps the most expensive thing imaginable, the motor cyclist's expenses must be credited with a considerable sum in pounds sterling under this heading. Far, far better buy a gallon of motor spirit than a gallon of medicine.

THE BRITISH MOTOR CYCLE INDUSTRY.

An Analysis of Specifications of the Motor Cycles available in this Country.

LAST week's Spring issue of *The Motor Cycle* contained an illustrated Buyers' Guide in which we gave particulars of the models of 130 makers. The particulars given were provided by the makers themselves, and a careful study revealed an abundance of interesting facts. Needless to say, to obtain reliable statistics covering so many points entailed a great deal of detail work for *The Motor Cycle* statistician, who, incidentally, disappeared for many hours behind his locked office door.

From the results of this "count," we discover that 130 manufacturers (including five foreign makers exporting to this country) offer between them no fewer than sixty models, so that the prospective buyer who cannot find a machine to fulfil his requirements must indeed be very hard to please. Without counting models embodying such options as plain two-speed gears in lieu of a gear box with kick-starter, the specifications of the following general types were tabulated in the Buyers' Guide.

V twins		52
Single-cylinder:		
Four-strokes	92	171
Two-strokes	79	
Flat twins		17
Two-cylinder two-strokes		2
Four-cylinders		3
		245

Of the 130 manufacturers, sixty-one produce their own engines—some of these also buy engines of types they do not manufacture. Thirty-eight make their own gear boxes.

The chief manufacturers of proprietary engines and gear boxes figure in the statistics as follows:

ENGINES.

30	makers specify	Villiers engines.
29	" "	Jap "
28	" "	Blackburne "

GEAR BOXES.

56	makers specify	Sturmey gears.
22	" "	Burman "
20	" "	Albion "

Since the small capacity lightweight is offered by so many firms, engines between 200 and 300 c.c. naturally head the list of engine sizes, but the popularity of the 2¾ h.p. Blackburne four-stroke and the 3½ h.p. Precision two-stroke enhances the figure referring to engines of 300-400 c.c. capacity. Here is the list in order of numbers.

200-300 c.c.	98	600-700 c.c.	19
400-500 c.c.	43	500-600 c.c.	16
300-400 c.c.	42	700-800 c.c.	14
800-1,000 c.c.	22	Under 200 c.c.	3

Since the Armistice, there has been a marked falling off of the 750 c.c. twin so popular before the war, while the 400-500 c.c. class, at one time apparently heading for extinction, has been revived by the number of makers using 4 h.p. Blackburne engines.

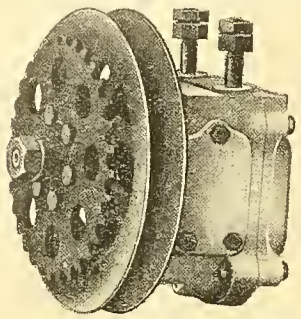
As was to be expected with so many lightweights offered, chain-cum-belt transmission leads with 179, all-chain being second with seventy-three. There were seven all-belt machines, but it should be pointed out that nearly every maker of a two-stroke lightweight offers a single speed model with belt drive. The F.N. is still the only example of shaft drive.

The Number of Ratios.

Most manufacturers of two-stroke lightweights offer single gear models, but undoubtedly the largest demand is for a two-speed machine. The large majority of the single-speed mounts have all belt drive, but in one case, a countershaft is fitted. Very few four-strokes are offered as single-speed machines; the majority being T.T. models of the 500 c.c. class.

Notwithstanding the large number of lightweights which generally have no more than two speeds, the three-speed mounts total very nearly the same figure, but four-speeders are confined to the A.B.C., and an Olympic lightweight with Juckes gear.

Two speeds	135	Variable	6
Three speeds	115	Four speeds	2



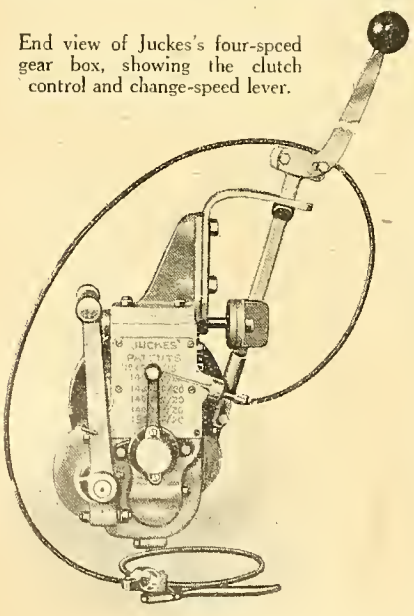
The general increase in tyre sizes is a point upon which we commented at the time of the Olympia Show. Below we give the numbers of machines given in the Buyers' Guide fitted with different sizes of tyres:

24×2in.	5	26×3in.	13
24×2¼in.	3	650×65 mm.	22
26×2in.	13	700×80 mm.	5
26×2¼in.	109	27×3½in.	3
26×2⅜in.	9	28×3in.	31
26×2½in.	54		

A NEW FOUR-SPEED GEAR BOX.

A Proprietary Unit suitable for all Types of Motor Cycles.

NEW gear boxes are by no means rare nowadays, but the advent of a new four-speed box is not at all so common. Furthermore, it requires considerably more ingenuity to design an example of the latter type of box that



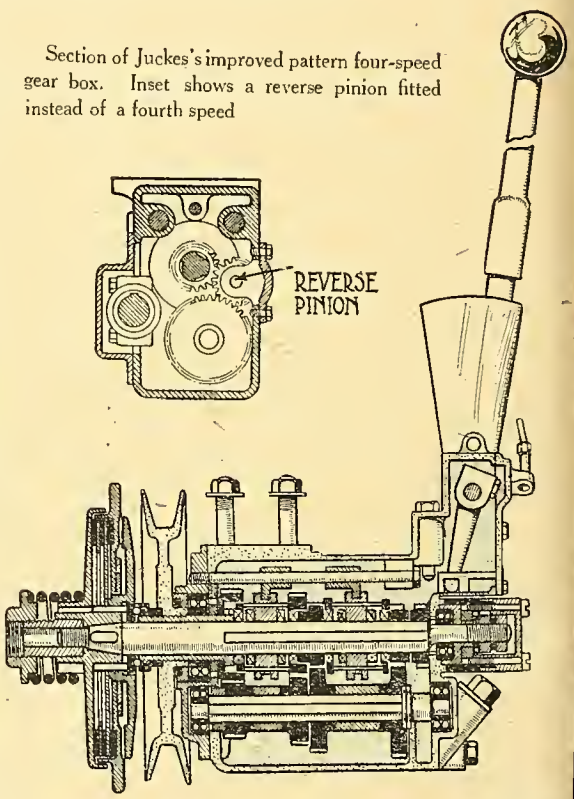
Very small, neat and light is the Juckes plain two-speed box.

will not be unduly wide and unwieldy than it does in the case where only two or three ratios are required.

Minimum Overall Width.

On the gear under review, the Juckes (manufactured by the Efficient and General Engineering Co., of East End Works, Bilston Road, Wolverhampton), several clever patents combine to keep the overall width down to a reasonable extent without sacrificing reliability or strength.

Constant mesh pinions are used throughout, all eight being arranged for ease of replacement. For the purposes of explanation, however, the layshaft may be regarded as one revolving mass; three of the main shaft pinions revolve freely on that shaft, and the fourth, following usual practice, is mounted on a sleeve which also takes the final drive pulley or sprocket. Two double dog clutches, keyed to, and revolving on, the main shaft, clutch up the various pinions for the different ratios in the conventional manner, the top gear being direct.

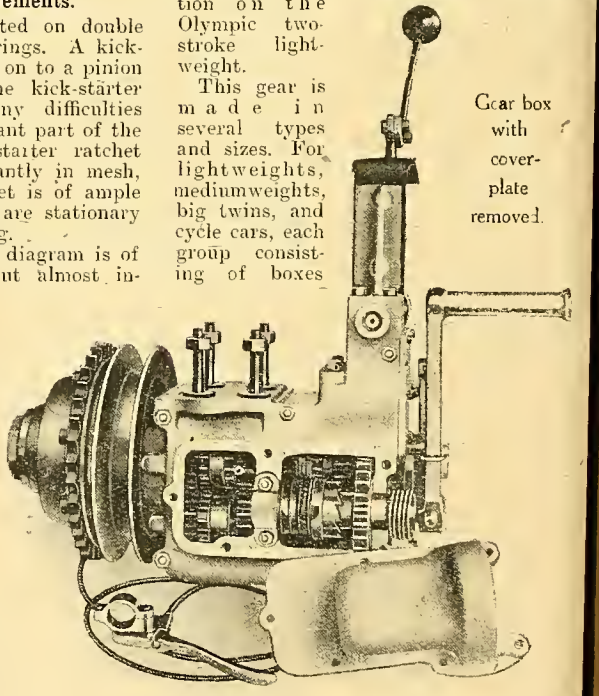


End view of Juckes's four-speed gear box, showing the clutch control and change-speed lever.

It is in the method of mounting these main shaft pinions and of forming internal dogs *inside* the pinions themselves that new ideas have been brought to bear. As will be seen from the diagram, none of the dogs on the pinions project much further than the pinion teeth. Distance washers, bridged by rods passing through the revolving dog clutches, "position" these pinions and prevent any lateral movement.

The clutch works in an entirely novel manner. A patented cam gear moves the whole mainshaft *inwardly* against a powerful coil spring from the clutch side, taking with it the inner member. The outer clutch member is prevented from following, by distance pieces bearing indirectly against a thrust ball race on the main drive sleeve.

Section of Juckes's improved pattern four-speed gear box. Inset shows a reverse pinion fitted instead of a fourth speed



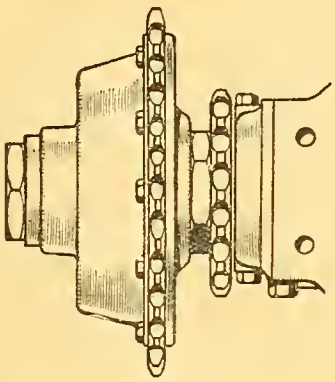
Kick-starter Improvements.

Both shafts are supported on double race self-aligning ball bearings. A kick-starter pinion acts directly on to a pinion on the main shaft. The kick-starter mechanism overcomes many difficulties connected with this important part of the modern gear box. The starter ratchet gear and pinion are constantly in mesh, while the free-wheel ratchet is of ample proportions, and all parts are stationary when the engine is running.

The clutch shown in the diagram is of the Ferodo plate type, but almost invariably a cone clutch of simple design and Ferodo lined is fitted. The ease of operation of this clutch is most pleasing, and, when out of engagement, it is quite free.

This gear box is certainly a simple and easily detachable design and should not lack in wearing capacity or easy gear changing. A final point regarding it is the fact that the addition of an extra pinion is almost all that is required to convert the low gear to a reverse, and so make it suitable for light cycle cars, in which service we have seen it many times. Visitors to Olympia last November may recall that this gear box attracted considerable attention on the Olympic two-stroke lightweight.

This gear is made in several types and sizes. For lightweights, mediumweights, big twins, and cycle cars, each group consisting of boxes



Gear box with cover-plate removed.

providing two, three, or four speeds, or, in the case of cycle cars, three speeds and reverse.

One advantage of the Juckes gear is that if a purchaser first has a two-speed box, he may convert it easily to a three or four-speed box by purchasing the necessary pinions.

Size and Weight.

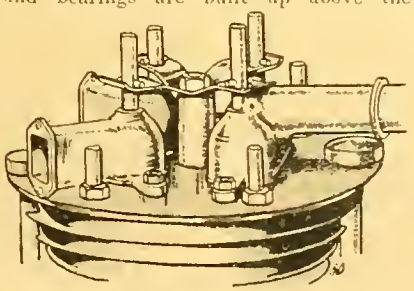
At first glance the Juckes gear box appears to be rather larger and, consequently, heavier than usual, but this is quite an illusion—in fact, any of the boxes are probably lighter than the majority of similar gear boxes. The enclosing of the control mechanism, and making this integral with the box, accentuates its bulk, but is certainly a very good point. It obviates the necessity for tank brackets, which generally must vary in dimension on each different make of machine.

Exterior of the Juckes cone clutch.

In addition to this series there is also a small plain two-speed—probably the smallest gear unit we have seen.

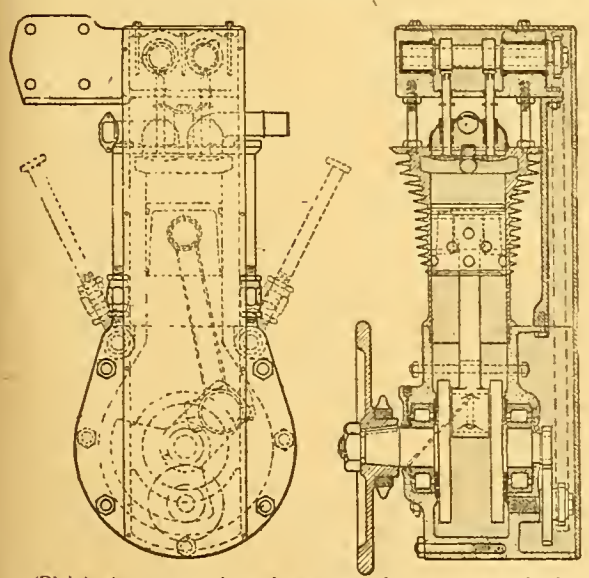
The Efficient Co. has now opened a department for converting out-of-date machines for those who are unable to have the work done locally, and here we recently saw several interesting conversions under way. One was an old Rudge converted into a modern three-speed countershaft mount, another a two-speed hub model Reading Standard, which was having three speeds and reverse fitted, while there were several other hub gear models and also a brace of old cycle cars being brought up to date.

A Small High Efficiency Engine.



Four Overhead Valves, but only One Valve Spring embodied in a Compact 2¾ h.p. Power Unit.

DESIGNS and blue prints have come into our hands of what promises to be a remarkably efficient little engine of, nominally, the 2¾ h.p. class. The valve gear arrangement in particular shows considerable originality, but the layout as a whole is also very ingenious.



Overhead Camshafts.

Two overhead camshafts, driven by a single chain running at half engine speed, serve to operate the four overhead valves. Usually such a construction demands a great increase in overall length in order to make room for the valve springs, but in this case a single, diagonally tongued spring of flat steel does the work of four of the coil type. The action and shape of this spring is clearly shown in one of the drawings.

Two "cheese-headed" rods, extensible by means of right and left-hand threads and nuts, and pivoted on the crank case, hold the cylinder down through slots in the upper flange. The cam gear box and bearings are built up above the cylinder on studs, and the magneto platform is immediately adjacent, the magneto being driven from an extension of one of the camshafts. Separate castings are used (as shown) for each dual inlet and exhaust manifold.

Showing how a single spring operates four valves.

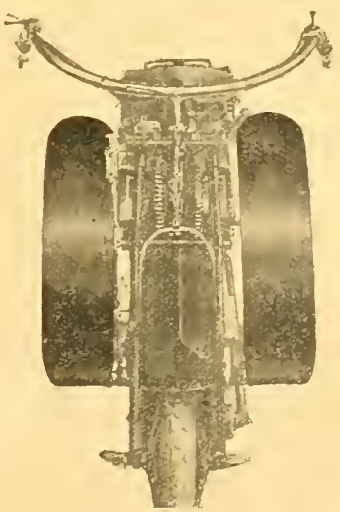
(Right) A cross section of the Ajax Super engine, clearly showing the general layout. (Left) A side view, showing the magneto platform, and indicating how the cylinder holding-down bolts swing outwards to permit removal of the cylinder.

With the exception of the main crankshaft roller bearings, plain bushes are fitted throughout. An outside flywheel carries the transmission sprocket on a screwed boss.

Lubrication.

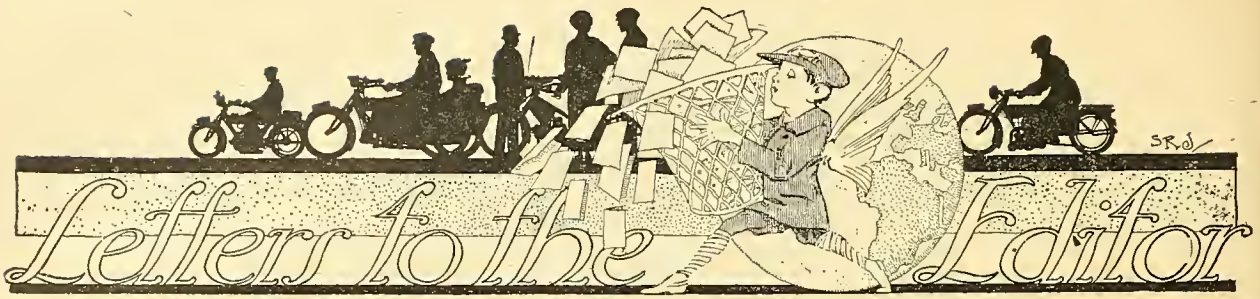
Oil grooves and a drilled crankshaft web lead oil to the big end, while splash ensures that the cylinder walls do not go dry. The lower end of the timing chain cover also forms an oil trough.

Other good features particularly noticeable are the massive camshaft bearings and the great thickness of the cylinder at the head.



A bore of 70 mm. and a stroke of 90 mm. give the Ajax Super engine (as it will be called) a capacity of 346.4 c.c.

The designer is Mr. A. J. H. Elverson.



LEG GUARDS FOR ARIELS.

SPECIAL leg guards for Ariel motor cycles have recently been designed by the makers of this well-known machine, and are illustrated here. As will be seen, they present a handsome appearance, and do not interfere with the accessibility of the machine in any way. It is said that, if anything, they rather improve the cooling of the engine.

The method of fixing is very simple, the bottom portion being bolted to the foot plate and a cross member connects the top portion to the tank tube. The price is 25s. per pair, and they can be supplied by the makers either fitted to new machines, or for fitting to existing Ariel motor cycles.

The new Ariel leg guards.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A POSER FOR "IXION"!

Sir,—Just a line about "Ixion's" recent comments on head lamp glare. Perhaps he will explain how he knew the makes of the two cars which caused him such discomfort, as he says he could not see. Both cars were going downhill, so he could not tell by their exhausts.

H. EVANS.

BLAMING E.P.D.

Sir,—With reference to the letter in your journal by Mr. A. Ball, I rather think that this gentleman has lost sight of the fact that the manufacturer who had the advantage of buying stocks cheap, and selling finished articles at a high price, had to pay 80% of this profit to the Exchequer, which percentage has been slightly reduced since.

He is now landed with a lot of high priced material and has now no chance of recovering from the Exchequer the losses he will make on his dearly bought stocks.

St. George's, E. AN INTERESTED READER.

KEEPING CLEAN—ONE WAY.

Sir,—I have been a reader of your excellent paper since 1912. Thoroughly enjoying the correspondence columns, I have read with interest of late the remarks *re* mudguarding, and have solved the difficulty which for years has ruined my "bags."

Much against the advice of several friends, who described it "dangerous," etc., I bought a Morgan, and actually went a distance of sixty odd miles on a recent Sunday over muddy roads with a new suit on.

I consider this sturdy little machine a much better proposition than all the sidecars I have had, both for protection and comfort. Has "Ixion" tried one? I have a hazy recollection of a run to Scotland several years ago, when he gave his experiences. L.F.P.

Liverpool.

FOUR-STROKING.

Sir,—I have read with interest the letters in your recent numbers concerning four-stroking of two-stroke engines.

I have for some time past been riding an S type Metro-Tyler. As is well known, this machine, presumably owing to its piston and port design, two-strokes with great regularity, and can only be persuaded to four-stroke under the greatest provocation.

I recently obtained from the makers of the machine a W.S.R. variable jet with a special long rod attachment, enabling it to be controlled from the top of the tank.

I fitted this in the hope of improving flexibility and consumption, and I find that its use enables me to stop four-stroking immediately, if it does occur at all. A very slight weakening of the mixture is all that is required.

G. E. CUFFE.

"PETREAU" POSSIBILITIES!

Sir,—As a would-be motor cyclist I am watching developments, and the "Petreau" system, foreshadowed by "Ixion," would almost persuade me if it could be developed into a commercial proposition. I read some time ago that an enterprising Yankee was able to run a car on a pail of water and dope, but it seems to have been a wash-out. "Ixion" informs us that his friend ran half a mile on a mixture of petrol and water. If this can be done on an ordinary machine fitted with the usual contraptions, there is room for a brand, not yet tapped, by the numerous carburetter manufacturers whose professions seem all alike to me. The man who can guarantee 100 miles on a gallon of "half and half" will reap his reward. This would be much cheaper and cleaner than the petrol system, and any further information on the subject will be gratefully received by

London, N.W.2. PETRO.

PILLION RIDING.

Sir,—I have read with interest, in one of your last numbers, the letter of your Belgian correspondent, M. Taymans, but do not agree with him that it is a "silly thing" to carry a fair passenger sitting sideways on the carrier.

Last year I covered about 4,500 miles on all kinds of roads on my old 1914 Douglas, with my wife as a passenger, and always the same way. She only tried once to sit astride for a few miles, but said she would never try again.

I must add that I once fitted footrests, but soon discarded them, as they were never used. As a pillion seat I use a sprung leather cushion (sold everywhere in this country), which, beside being really comfortable, does not spoil the appearance of the machine, on which it is permanently fitted.

With both up, we average about 28-32 m.p.h. on long distances, and have already made several journeys of 125 miles in one day without the slightest discomfort.

Brussels. JEAN C. WATELET.

DEFINING 'SILENCE."

Sir,—I must apologise for again writing to you on a subject which by now must be getting worn threadbare, but as I have recently figured as a witness in a police court case, the result of which, I think, may be of interest to several manufacturers, I again crave your indulgence, and trust you will allow a little space for the publication of this letter.

My friend, who has a long exhaust pipe with fish-tail muffler fitted to his machine, was summoned for a noisy engine. We both attended the court, and put up a pretty fair defence as follows: "The law states that a machine must be fitted . . . or *other contrivance* sufficient to make the machine reasonably silent."

No mention is made that a silencer must be fitted, therefore we contended that the machine in question was complying with the law, and finally managed to get several of the magistrates sitting on the bench to view the machine, in order that we might demonstrate that it was reasonably silent. In addition, we pointed out that several makers now fitted a long exhaust pipe as a standard fitting to their machine.

The case finally went against us, as the magistrates were of the opinion the machine was not reasonably silent; also (and this is where the manufacturers should take notice) the magistrate's last words were: "If the makers are turning out machines with long exhaust pipes, the sooner they stop this practice the better."

Now, it amounts to this. Either we are barred from using our machines on this particular road, which, by the way, is the main road leading to a favourite hunting ground for Manchester motor cyclists, viz., North Wales, or we are compelled to choose a machine with a silencer.

What are the manufacturers' views on this subject?

Individually, we are powerless; but, collectively, surely some definite ruling on this vexed question might be obtained.

E. E. HOWELL.

VARYING PRICES OF SPARES.

Sir,—Requiring some spare parts made of a well-known proprietary material, I wrote to the manufacturers, and also to the makers of my machine for prices. Their quotations were, respectively, 4s. and 6s. 2d., postage extra. In both cases the above prices were for the part complete and ready to fit at once. This means that the makers of my machine add over 50% to the cost of this particular spare part, purely as profit and to cover office expenses. Twenty per cent. might be considered reasonable; 50% seems unreasonable and excessive. Such dealing on the part of motor cycle manufacturers will hardly assist in restoring the good times which I believe they ardently hope for. C.V.M.-W.

Rotherham.

ALUMINIUM ALLOYS TO REDUCE TAXATION.

Sir,—In the past the question of the employment of aluminium alloys in motor and motor cycle construction has often been considered, but the invariable answer has been that the extra cost involved rules out this possibility.

Now that weight is such an important factor, manufacturers of motor cycles, which scale just over 200 lb., must consider whether the use of aluminium alloys will not pay them as a real commercial proposition. It is certainly worth while saving 30s. per annum on the tax; and, if the cost of the suggested refinement is not prohibitive in relation to the yearly saving effected, it certainly has every advantage to recommend it. Not the least of these is reduced petrol consumption, representing a further set-off to the extra initial cost. L. S. LYONS.

BRITISH V. AMERICAN SPEEDS.

Sir,—I am afraid that your correspondent "Chemist" is rather too much chemist, and too little engineer. He explains, to the complete satisfaction of himself, and, for that matter, anyone, the reason why, owing to differing atmospheric conditions, an engine develops greater power in America than it would in England. But if he thinks that this causes the difference in speed (if such variation does exist) he is wrong.

At high speeds, if the power of a motor cycle were doubled, the speed, unfortunately, would not also be multiplied by 2. The factor would be far nearer to 1.25. The reason for this is that, while the impelling force on a machine increases in the same ratio as the power, the resistance to motion, which at such speeds is chiefly due to the air, increases far more rapidly. I will not quote statistics, as that is a thankless job at best; but if "Chemist" will consult any work on this subject he will find that it is so.

To return to his figures, he gives the American engine (American by virtue of situation, of course, and not necessarily of nationality) an increase in power of 1½%. Were the actual speed increased by this amount the difference would be very slight. Actually, for such an increase in power, at, say, 70 m.p.h., the speed increase would be negligible.

Highgate, N. NY 3315.

Sir,—"Chemist's" explanation is clearly based on a fallacious reason also. He states that 31 c.c. of benzene require for combustion 1,000 c.c. of air; by calculation from these figures 156 parts by weight C_6H_6 would require 433 parts by weight of O_2. The equation, now given correctly,

$$2C_6H_6+15O_2=12CO_2+6H_2O$$

indicates that 156 parts by weight C_6H_6 require 480 parts by weight of O_2, and not 433 as calculated from first statement, or 240 as stated later in his letter.

Further statements made by "Chemist" are erroneous. One example will suffice: 0.195 gr. benzene will reqoire 2,146 c.c. of "English air at 20°C," which is considerably in excess of the hypothetical cylinder's capacity.

I fear that "Chemist's" theory built upon aqueous vapour tension hardly meets the case in point; he might, however, submit it as an explanation of the question, "Why do engines appear to run better at night?" or other less involved questions. ERIC C. PORTER.

Sir,—May I trespass on your space once more? With regard to the remarks made by "J.K.D.C." in your issue for March 3rd, I maintain that an American twin on the track is no faster than a British twin of equal capacity. I am perfectly well acquainted with the Brooklands records, and would prove my point by a reference to the last championship meeting during the autumn of 1920. If "J.K.D.C." had been there, and witnessed the 1,000 c.c. solo race, he would perhaps have moderated his opinion. I admit that Le Vack on the Indian won the race, but I think it was generally agreed that Remington on a N.U.T.-Jap was faster. Unfortunately, Remington had plug trouble, and lost a lap. He started up (after changing the plug) considerably behind Le Vack (100 yards, I should imagine), and when they came round again Remington was leading by fifty yards.

Your correspondent "J.K.D.C." may say that the Indian shut down a little, on knowing that he had the lead, but that is hardly possible on a throttle-less machine, and, moreover, in the first lap the N.U.T. proved faster.

The whole point is that there were (last year) so few trade-driven and supported twins of British manufacture, but this year, I believe, will alter matters somewhat.

L. W. G. HARTLEY.

REVERSING ON SUDELEY HAIRPIN.

Sir,—With reference to your report of the Colmore Cup trial on page 300, you state that both T.B.'s got into difficulties on the Sudeley hairpin.

In fairness to the manufacturers of this excellent little three-wheeler, I should like to say that I had no difficulties at the hairpin, but considered it quite impossible for a standard machine, and therefore I did not attempt to take it. I simply reversed once and carried on, and I think you will agree with me that no cycle car could possibly take the above-mentioned hairpin on standard steering lock.

When I received my entry form for the Colmore Cup trial, no mention was made thereon of reversing, and I did not know, until I received my route card, that reversing would not be allowed. As very few private owners have facilities for altering the steering lock of their cars to enable them to take such angles as the Sudeley hairpin, it would appear that the conditions are not mapped out to encourage private owners to enter their cycle cars, and it would therefore be interesting to know what other private owners and also the A.C.U. have to say about this matter.

JAS. WAINWRIGHT.

ILLUMINATING ROAD OBSTRUCTIONS AT NIGHT.

Sir,—It is the practice of many authorities to illuminate road obstructions at night by means of red lamps, regardless of the position of the obstruction.

A red lamp ahead when attached to a vehicle is an indication that it should be passed on the off side; but in the case of a road obstruction in the centre or off side of the road the red lamp may have to be passed on the near side.

These two cases are indistinguishable to the oncoming motorist in the dark, and it would therefore appear to the writer to be preferable to illuminate the road obstruction, when at the side of the road, by means of red lamps on one end and white lamps on the other, as though it were a stationary vehicle in the roadway. In the case of an obstruction in the middle of the road, white lamps only should be used to indicate to oncoming motorists in either direction that it should be passed on their near sides respectively.

I think perhaps the authorities concerned might be approached on this matter, preferably through one of the associations which exist to look after the interests of the motoring public. W. D. EDWARDS.

Obverse and reverse of the heavy and well-designed silver medal awarded in the Anglo-Dutch Trial last year.

WELDING COSTS.

Sir,—Kindly allow me space in your valuable paper to relate briefly my experiences with regard to "Welding Costs," a small article on which appeared in your issue of January 27th. My 2½ h.p. machine had poor compression, and on examination I discovered a minute crack in the exhaust valve seat. I wrote describing the damage to a welding concern in Scotland for an estimate, and in reply the firm stated that until they had inspected the cylinder they could not give cost of repair.

I forwarded the cylinder, and in due course it was returned accompanied by an account for £3 18s. for repair. With carriage expenses the job cost £4 5s., for which sum I could have purchased a new cylinder complete. The fins were damaged in transit, and the amount claimed for damage was to be refunded, but up to the present there is no word of anything. In conclusion, let me state that, though I considered the charge excessive, the repair was executed in a thoroughly workmanlike manner, and the engine is giving entire satisfaction. CRAIGNAIR.

Dalbeattie.

LET SLEEPING DOGS LIE!

Sir,—The dazzling head lights that have recently been the subject of much comment in your paper might, perhaps, have just as well been left in the dark. Motor cycles, with their varied assortments of Government gim-cracks, already bear sufficient resemblance to early Victorian mantlepieces without adding any further to the collection.

The 20 m.p.h. limit that still exists, and the disgraces, sometimes referred to as roads, somewhat worse now than a year ago, surely provide enough material with which to keep the official nose to the grindstone, until it gets tired of it, and does something.

The authorities (I use the word in its purely conventional sense) would no doubt delight in enforcing some coal-scuttle-like proturberance to be carried over all head lights, and various firms would be only too pleased to market such impedimenta at about three times their value. For my part, however, although I hate them as strongly as anybody when I meet them, I can forgive the offending head lights much of their brightness, in remembering that they, at least, have not yet suffered official degradation. CE 6264.

Bexley Heath.

EVERYTHING BIG PREFERRED IN AMERICA.

Sir,—I have just received the copies of *The Motor Cycle* dated January 20th and 27th.

In the former number I noticed the road test of the 8 h.p. Brough Superior. I have often wondered why such a machine was never manufactured before now.

If only a few more firms went in for a decent powerful twin for solo work, instead of manufacturing such unsightly lightweights as we sometimes see!

At the present time I am riding an Indian solo, one of the new oversize motors (seventy-two cubic inches). I have ridden all winter, and winters are no picnic in the Great Lake district either.

Quite a few numbers back one of your readers asked for experience regarding 26×3in. tyres on a Cleveland two-stroke.

What could give easier riding? Before I left England, a year and a half ago, I had an O.K. Junior fitted with a M.A.G. engine. The machine itself was fine, and I never had any trouble with it. But the tyres (26×2¼in.)—I could never take a decent run without some kind of tyre trouble.

New York. K. T. ROBINS.

THE BALANCE OF MOTOR CYCLE ENGINES.

Sir,—The great interest taken in this question of balance by your readers has stimulated me to go a little deeper into the graphic representation of the unbalanced forces as shown in the original article of *The Motor Cycle* of February 3rd.

I noticed that the author only represents the unbalanced forces acting along the crank centre line, and thus neglects the effect of the forces tangential to the crank radius, which, evidently not being zero at all crank positions, produce a reaction capable of balancing partially. Hence the diagrams cannot represent the total unbalanced forces existing in any but such crank pin position where no tangential forces exist, *i.e.*, top and bottom dead centre.

It is interesting to note that for this reason his investigation of the amount to be balanced for single cylinders is not materially affected, as the dead centre position is playing the leading *rôle* in arriving at this amount.

However, as soon as angular positions of the crank pin are being introduced, as is the case with V twins, the graphs can no longer represent the facts. He only balances, as mentioned before, the radial forces along the crank, and the result is that the weights recommended for twins work out too small.

Also I doubt if the abrupt changes in the curves shown will still exist if the tangential reactions are included in the investigations.

The author is to be congratulated on stimulating the interest of your readers by concentrating them a little on this absorbing and important question of balance, and no doubt the various correspondents are looking forward to the author's reply to the "Yeas" and "Nays" coming through with bewildering confusion.

G. FUNCK, A.M.I.A.E.

BEVEL DRIVE ON THE A.B.C.—AND OTHER MATTERS.

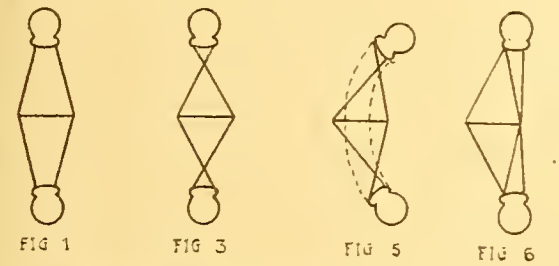
Sir,—My experience may be of interest to the Aberdeen reader, "M.J.R." When I first took over my machine, the bevel wheels in rotating made a high pitched shrieking noise, however much oiled. I took out the bevel-shaft and found that the bevel wheels were only just engaging. In trying to reassemble, I smashed the self-aligning ball bearing on the end of the shaft. (Very clumsy, no doubt; the spanner broke first.)

The remedy is not to try and take the shaft out, but to screw up the large gland behind the chain sprocket whilst gently knocking the sprocket end of the shaft to drive the bearing further home. Do this until the back lash in the bevel wheels is only just perceptible, taking care, of course, that the back lash of the bevel wheels is being felt and not that in the gear box.

In turn, I should like to ask readers how is it possible to take out the gudgeon pins? Mine appear to be bevelled over by hydraulic pressure or some such means.

Re the correspondence about four-stroking on two-strokes when moving comparatively fast on a light road, *i.e.*, at small throttle openings. My remedy was to fit a W.S.R. adjustable jet, and close it just a trifle as the engine started to four-stroke. This effects considerable economy and higher speeds; also frequent stops, unless the jet is opened again before opening up the throttle for a hill.

I should also like to ask Mr. J. A. Peters how he avoids the condensation of steam from the exhaust gases in his automatic lubrication system. This is a very serious defect in exhaust pressure-fed fuel systems on cars. Owing to gaseous diffusion it is difficult to keep the tank supplied with only carbon dioxide and nitrogen. N.S.D.



A WIN FOR GREAT BRITAIN IN THE ITALIAN ROAD RACE.

Nino Vanoni (8 New Imperial) finishes first in the "Second Italian Winter Cup" Race held at the end of last month. Another New Imperial was second, a Frera third, and a Triumph fourth.

MOTOR CYCLE WHEEL DESIGN.

Sir,—In Mr. Edwin Smith's letter on motor cycle wheel design in your issue of March 3rd, he has fallen into the old familiar error of regarding the spokes and rim in the plane of the paper as being the only essential features. He ignores altogether the spokes and those parts of the rim which are not in the plane of the paper, and he ignores the great part they play in the complicated but beautiful structure of a wire wheel. But Mr. Smith does worse than this. He assumes that the section of the rim is held in the plane of the paper with the two edges or lips always horizontal, or it is under such conditions that his fig. 3 would be as strong as his fig. 1. We have ventured to add fig. 5, which shows what would really happen to fig. 3.

Diagrams illustrating Mr. John Pugh's letter on motor cycle wheel design.

Sound theoretical investigations as well as years of road experience and laboratory tests have shown that fig. 1 is definitely superior to fig. 3, because fig. 1 prevents rim twist or buckling, and fig. 3 encourages it, and thus encourages the wheel to collapse.

Rudge-Whitworth, Ltd., were probably the first firm to realise the advantage of placing the spokes as wide apart as possible on the rim. This was in "bicycle" days, and later on in the analogous technical application of wire wheels for motor cars introduced the triple spoked wheel, which permits a great amount of dish and yet preserves the essentials, viz., great strength from the side on which the biggest forces are applied and the absolute prevention of rim twist. This is illustrated in fig. 6.

JOHN PUGH,
RUDGE-WHITWORTH, LTD.

INCREASED INSURANCE RATES—IN A NUTSHELL.

Sir,—It may be no secret that the insurance of motor cycles at the competitive rates that have been charged in the past has resulted in a loss to the companies transacting this class of business. From March 1st, however, uniform rates will be charged, and a standardised policy issued. Premiums will be revised, which means that they will be increased, in many cases to a considerable extent.

Overhead charges in the form of licence duties and insurance will henceforth amount to a large sum, and since the former cannot be reduced, it is necessary to see what economies can be effected in the latter.

There are three scales in the new insurance rates, viz.:

Scale A, insuring—
(1.) Liability to the public.

Scale B, insuring—
(1.) Liability to the public.
(2.) Fire.
(3.) Burglary.

Scale C. Risks as B, also accidental damage.

Scale A is the cheapest policy. Scale B costs 50% more than A. Scale C costs 150% more than A.

It is essential for every motorist to insure against liability to the public, or third party. With regard to the other risks, the premium demanded to cover fire and burglary works out, roughly, to 20s. per cent., and this rate, in the writer's experience, of similar risks, is by no means excessive. It should be remembered that a claim under either of these heads is invariably a total loss. It is therefore advisable to cover fire and burglary.

In regard to Scale C, the liability to accidental damage is roughly proportional to the extent the machine is used, and the fairest way would be to rate this risk according to mileage. This method is impracticable, however, and so the motorist should consider whether he rides his machine a sufficient number of miles during the year to justify the heavy additional premium. The premium for a sidecar is the same as for a solo machine, whereas, as every motorist knows, the risk of damage to the former, owing to its greater stability, is very much less than the risk of damage to the latter. It may therefore be advisable to insure a solo mount against accidental damage when it would be unnecessary to insure a sidecar outfit.

The scale of charges provide for a deduction of 15% when the insured agrees to bear the first £2 10s. of any loss, also for a bonus of 10% if no claim is made during the year. As all claims are recorded against the insured, it is seldom prudent to recover small sums. The motorist may, therefore, be advised to underwrite the first £2 10s. himself, and obtain the benefit of the reduced premium.

In the new insurance rates, an extra premium of 10s. is charged for each £50 by which the value of the machine exceeds £100, and a surcharge of 50% is made when a solo mount is used for pillion riding.

INSURANCE MAN.
Crouch End, N.8.

ORDER OF MERIT IN THE SIX DAYS TRIALS.

Sir,—Will you allow me through your columns to thank "Pegasus" for his remarks?

I should also like to say that, as a rider in the Velocette team, I should not have risked anything to spoil our chance for the coveted Trade Team Prize. I had every confidence that my machine was equal to all I could get out of it.

E. F. GOODMAN.

SUMMARY OF CORRESPONDENCE.

The naked chain still possesses a warm coterie of adherents, and several of our readers take exception to the statements of "Chain Drive" and "H.M.B." in recent articles on the subject of transmission protection.

Mr. E. H. Lambert accuses the Northern dealer of less enterprise than his London *confrère*, particularly in the matter of accepting old machines in part exchange for new. His criticism is applied especially to Liverpool.

"Rudge It," from his experience of the speed and acceleration of the Rudge-Multi twin, welcomes the 7-9 h.p. all-chain model as a formidable competitor to the big American twins, which, as he states, it more closely follows in specification than any other British twin.

In the letter of Mr. J. A. Peters, with reference to his oiling system, which we published in *The Motor Cycle* of the 10th inst., we inadvertently omitted the following paragraphs:

"It has therefore been shown that, in the event of failure from any cause, ample warning is given, and as the supply of oil is perfectly automatically controlled to suit the requirements, there is no need whatever for a sight feed. In fact, the rider can forget his lubrication system altogether.

"As the gas in contact with the oil is not circulating, there is no question of contaminating the oil with sooty exhaust gas. Incidentally, with this correct system of lubrication, there is very little free carbon in the exhaust."

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

The 1921 London-Edinburgh Run.

Buttertubs Pass included in this Year's M.C.C. Whitsuntide Event.

THIS year competitors in the London to Edinburgh run will take in Buttertubs Pass. This further stiffening up of the M.C.C. Whitsuntide event has been decided before its Easter trial has been run off, which shows that the Competitions Committee of the M.C.C. has confidence in its present policy. There is no doubt that the stiffening of the London-Land's End regulations—and *The Motor Cycle's* criticism of their severity—has had the effect of making competition riders keener than ever to participate: in fact, we understand, had the rules of the club permitted, there would have been an entry of something like 400, most of whom decided to enter after *The Motor Cycle* had pointed out what lay ahead.

No Time for Delay.

Intending competitors in the sister event to Edinburgh at Whitsuntide have none too much time in which to make up their minds, for if they are not members of the M.C.C. they must make application to Mr. Southcomb May, 34, Gower Place, London, W.C., before Tuesday, April 12th.

This year's competitors branch off last year's route near Bolton Bridge, rejoining it again at Penrith. The new portion includes the ascent of Buttertubs.

Buttertubs Pass, the titbit of the run, was traversed in last year's A.C.U.'s Six Days Trials, and although it has not the bad surface nor the gradient of Park Rash, it is a hill in the same category, and a worthy substitute for Kirkstone, if not so long. Three miles, including the ascent of Buttertubs, will be a non-stop section; but this year that portion of the route over the hills near Moffat will not be "non-stop."

400 Miles in 24 Hours.

The trial will start from the Gate House, Highgate, at 7 p.m. on Friday, May 13th, and the first competitor is due to arrive in Edinburgh at the end of the 400 mile run twenty-four hours later. The trial will be divided into four sections with approximately an hour's stay at Grantham, Ilkley, and Carlisle.

Moribund Phrasing in Latest Government Order.

A Brief Review of the Road Vehicles (Registration and Licensing) Regulations.

IS it necessary for a sidecar outfit weighing more than 3 cwt. to carry car size number plates?

Have the authorities ever heard of such a vehicle as the sidecar?

Is there no one in the Government Department concerned capable of amending the phrasing of the Act of 1903 in order to bring it up to date, so as adequately to cover present-day requirements?

No Interpretation of the Law.

One is constrained to ask these questions after perusal of the Provisional Rules and Orders relating to the registration and licensing of road vehicles, dated March 9th, 1921. This Order gives full instructions with regard to the licensing and registration of all mechanically-propelled vehicles, including motor cycles. It is still most indefinite as regards the position in which licence holders can be placed on motor cycles (including motor scooters, motor cycles with trailers or sidecars, tricycles, and invalid carriages), as it is stated that in the case of these vehicles the licence must be in a conspicuous position on the near side.

The question of the granting of licences and the issuing of registration books is dealt with in great detail, but most of this information has previously appeared in *The Motor Cycle*.

So far as the registration numbers are concerned, it is still legal to have the front number plate painted on both sides and carried in the usual position. Should a forecar (of which there are none in existence at the present time) or a trailer (which form of attachment is likewise defunct) be attached to a mechanically-propelled vehicle (or, in other words, to a motor cycle), the plate is required to be fixed on the front or the back of the motor cycle, or a duplicate of such plate should be fixed on the front or on the back of the vehicle attached.

Lamps still have to be carried half an hour after sunset and half an hour before sunrise, and be kept burning; and the regulations point out that these lamps must be so contrived as to illuminate by means of reflection, transparency, or otherwise, and render easily distinguishable every letter or figure on the identification plate fixed on the back of any vehicle or of any vehicle attached to the back of the vehicle. The Order goes on to say, "In the application of this regulation to a motor tricycle or a motor bicycle of a weight unladen not exceeding 3 cwt., the plate fixed on the front of the vehicle may, if desired, be substituted for a plate fixed on the back of the vehicle." This, in ordinary English, means that, as has always been the case since there has been a Motor Car Act, a vehicle registered as a motor cycle, and weighing less than 3 cwt., may have either the front or back number plate illuminated; that is to say, if a red tail-light is carried, this need not necessarily illuminate the number plate if the front number plate is adequately rendered distinguishable by means of the front lamp of the vehicle.

Registration Details.

The regulations contain the usual illustration of the licence card and specification of licence holders, an up-to-date list of registration marks of the County and Borough Councils in England, Wales, Scotland, and Ireland, and also some sample illustrations of specimen number plates. The regulations affecting the size of index marks and numerals remain exactly the same as in the 1903 Act. These are given in detail, together with the old stipulation that in the case of the plates for a motor cycle or motor tricycle of a weight unladen not exceeding 3 cwt., each of the dimensions should be halved, and the shape of the plate need not be rectangular so long as the minimum space between any letter or figure and the top and bottom and sides of the plate, and the relative position of the letters and figures are in accordance with Clause 1 of the provisions of this Order.

Ambiguity of Requirements.

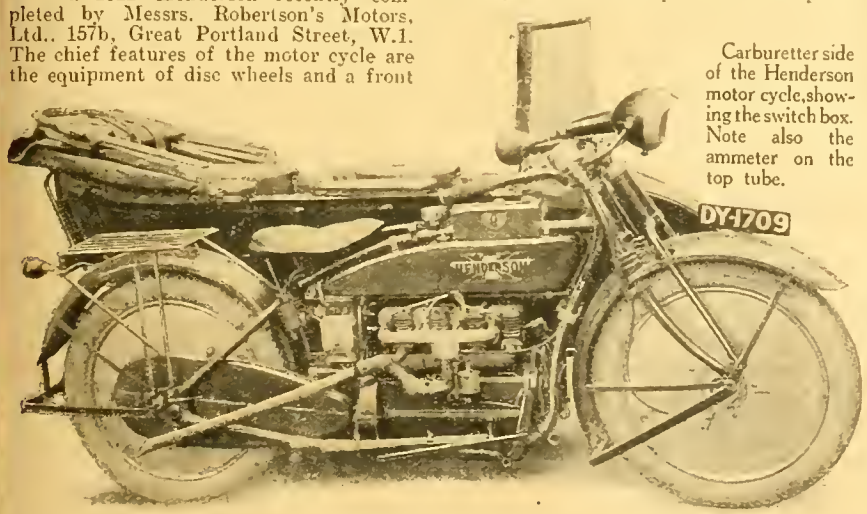
Now it will be noticed that on the first occasion on which motor cycles were mentioned in this brief review it is stated that motor cycles include motor scooters, motor cycles with trailer or sidecar, tricycles, or invalid carriages, but no mention is made of the sidecar in any other part of the regulations. Moreover, according to the Finance Act a vehicle can be licensed as a motor cycle which has not more than three wheels and does not exceed 8 cwt. in weight. It will be seen, however, that in the regulations under review wherever weight is mentioned it is the old weight limit of 3 cwt. The second reference is the one we have just made to the size of number plates, and it now seems that according to the strict interpretation of the regulations motor cycles exceeding 3 cwt., though they pay motor cycle licences, must carry car size number plates if the authorities exercise their power.

It is not fair to accuse the motoring organisations of not having tackled the Government on these subjects, as we know for a fact that the Motor Legislation Committee, on which both the A.C.U. and A.A. and M.U. are represented, strenuously fought this case with the authorities, but apparently without effect. We understand that these regulations are provisional for forty days, though they are still operative, and that a further deputation from the Motor Legislation Committee will be received by the Minister of Transport.

A 60 lb. LADY'S LIGHT-WEIGHT.

THE lightest lightweight, as a type, is bound to appeal especially to the lady rider, and it was with this in view that the Chandler machine was evolved. Pedal cycle, more than motor cycle, lines have been followed, and indeed many of the component parts are simply strengthened cycle fitments.

Spring forks will later be embodied in this 1½ h.p. Chandler lady's motor cycle, but even then it is claimed that the total weight will not exceed 60 lb.



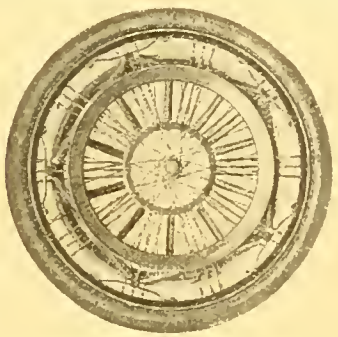
A J.E.S. 1½ h.p. four-stroke engine supplies the power, and the transmission is by a direct belt running over a jockey pulley. Closely resembling a lady's pedal cycle, the frame, however, has been modified and strengthened to withstand the additional stresses imposed on the self-propelled vehicle, and behind the steering head lies a triangular petrol tank. A large celluloid dressguard protects the rider's dress both from mud thrown up by the rear wheel and from the belt. Spring forks will be fitted to the final production model. This machine is made by J. P. Chandler, St. Botolph's Road, Shepherdswell.

A LUXURIOUS SIDECAR OUTFIT.

ONE of the most excellently fitted out sidecar outfits we have yet seen is a 1921 Henderson recently completed by Messrs. Robertson's Motors, Ltd., 157b, Great Portland Street, W.1. The chief features of the motor cycle are the equipment of disc wheels and a front stand, while quite an innovation is the inclusion of a P. and H. lighting outfit. The dynamo is neatly housed over the magneto and driven off the magneto-shaft by means of a wire belt. This electric lighting outfit is entirely self-contained, as there is a small auxiliary battery attached to the carrier of the motor cycle. There is also a larger battery in the sidecar locker, which is connected to the switchboard on the motor cycle by means of a plug. The small battery, therefore, serves to illuminate the machine when used as a solo, and it is quite adequate for supplying current for the head and tail lamps. The equipment includes an ammeter and change-over switch. The sidecar is a special Millford double-seater equipped with hood screen.

Access to the back seat is obtained by swinging round the back of the front seat and lifting up the seat itself. All three tyres are 27×3½in.

It is very noticeable from the illustration that the roomy two-seated sidecar does not look at all unwieldy when attached to the Henderson; indeed, the other extreme (a sporting single-seat body) would probably look much more of a misfit with such a massive machine.

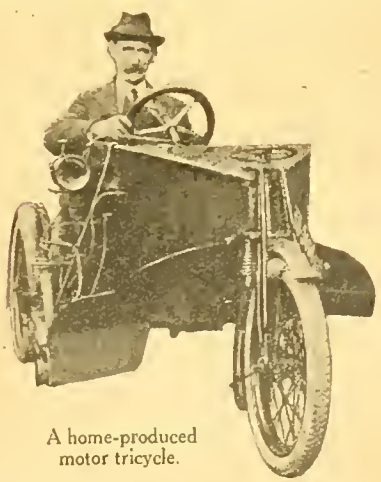


Carburetter side of the Henderson motor cycle, showing the switch box. Note also the ammeter on the top tube.

A FULLY SPRUNG WHEEL

IN designing a springing system the most important theoretical consideration is the reduction of unsprung weight to a minimum. Again theoretically, this reduction may best be carried out by making the wheel itself the springing medium, when also it should be possible to use solid tyres. Practically, there are many difficulties in the way of a spring wheel for the motor cycle, and for this reason the example we show, which has actually been tested on the road, is of some interest.

There are in reality three spoked discs, the larger annular one, which carries the tyre, floating between the other two on coil springs. Lateral rigidity, of course, depends on the fit of the annular wheel spokes in the slot formed by the two hub discs; but as these spokes are heavy and numerous, this difficulty should not be insurmountable. On the model illustrated the chordal springs provide a spring drive, while the radial springs look after the suspension.

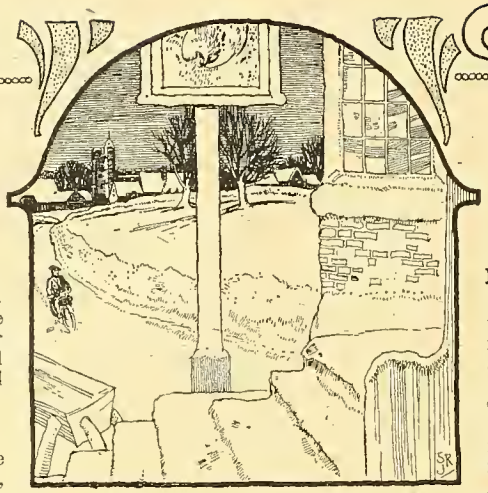


The wheel is the patent (17267/19) of Mr. G. H. Bagshaw, and is made by Bagshaw and Clowes, of 464, Ecclesall Road, Sheffield.

A fully sprung wheel, patented and manufactured by Bagshaw and Clowes, Sheffield.

SIMPLE MOTOR TRICYCLE FOR TWO.

WHY a runabout becomes a tricycle when the single wheel is placed in front is a moot point, but a machine so arranged usually is regarded by the public as a development of the tricycle. There have been many machines of this type on the market, notably the Wall tri-carriage in this country, the Duryea in America, and the Phanomobile on the Continent.



A home-produced motor tricycle.

Although the three tracks may militate against its popularity, the central steering obviates the drag which is present with a sidecar.

The machine illustrated is a home-constructed vehicle, built in spare time by Mr. W. J. Roy, of Ardrossan. As will be seen, a 3½ h.p. single cylinder engine is carried on one side of a small two-seater body, and drives through a countershaft gear box to one rear wheel, the transmission being by chain and belt. Coil springs are used at the rear, and a Druid fork at the front.

CURRENT CHAT

Special Features.

AN 8,600ft. CLIMB.
GUIDE TO LONDON-LAND'S END.
WHAT IT COSTS.

Times to Light Lamps

March 24th	... ...	6.48 p.m.
,, 26th	... ...	6.50 ,,
,, 28th	... ...	6.53 ,,
,, 30th	... ...	6.57 ,,

A New 350 c.c. Lightweight.

After a lapse of four years, the 2¾ h.p. A.J.S. has been reintroduced. The winner of two T.T. races, and the holder of several records, this 1921 three-speed model of a popular machine is catalogued at 100 guineas.

An R.A.F. Reunion.

In order to effect a reunion of the members of the 205th Squadron R.A.F., late 5th Squadron 5th Wing, R.N.A.S., it has been suggested that a dinner be held in London. Those interested should communicate with Mr. W. Jones, 43, Ranelagh Road, London, W.5.

Observers Wanted for Lynton.

Any motor cyclists in Lynton and neighbourhood who can offer their services as observers, etc., on Lynton Hill on Saturday morning, March 26th, are asked to communicate with Mr. E. L. Herring on Good Friday evening at the Valley of the Rocks Hotel, Lynton.

The International Six Days Trials.

The A.C.U. invites entries from riders of motor cycles who would care to enter for this trial and also with a view to making a selection for a team to represent Great Britain.

As has been previously announced in these pages, this year the International Six Days Trial will comprise a tour round practically the whole of Switzerland, and should prove a most attractive, as well as instructive competition.

Roadside Lighthouses.

Experiments are being conducted by the Ministry of Transport with devices for the illumination of dangerous turnings and cross roads after dark. We are informed that "flashers" of the type used on buoys and in lighthouses are being tried, and that these are of foreign manufacture. Why our own makers are not being called upon is difficult to understand, as the necessary apparatus, consisting of special valves and dissolved acetylene equipment, was made and tested for a like purpose some years ago, and is largely used in marine work.

Anti-mudsplashing Devices.

A series of tests were carried out by the Borough of Camberwell on March 14th last to ascertain the possible efficiency of anti-splashing devices for attachment to the wheels of motor cars. The competing cars were driven over a pot-holed, muddy stretch of road between white screens on which the height and extent of splashing were observed after the vehicles had passed at a predetermined speed. Full details and many illustrations of the devices used were illustrated in last Saturday's issue of *The Autocar*.

Trouble in Belgium.

As we have previously mentioned in these pages, the same unity does not reign among motor cyclists in Belgium as it does in England. The Committee of the Belgian Motor Cyclists' Federation refuse to recognise the trial run on March 6th by the Motor Cycle Club of Seraing, and the licences of competitors who took part in this event have been suspended, while those riders who have not yet taken out their licences are now debarred from doing so.

Motor Cycle Racing at Brooklands.

The first members' meeting this year of the B.M.C.R.C. will be held at Brooklands on April 16th, 1921. Event No. 1 will be time trials for one kilometre and one mile in one run. All classes will be provided for, including three and four-wheeled cycle cars.

Following this there will be eight three-lap scratch races, viz., five races for solo machines, two for motor cycles with side-cars, and one for cycle cars. The entry fee will be 5s. each event, and entries close Wednesday, April 6th.

B.M.C.R.C. race meetings will in future be run under the revised racing rules of the club now in preparation. The hon. sec. of the B.M.C.R.C. is Mr. T. W. Loughborough, the Mill House, Upper Warlingham, Surrey.

THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

The Autocar Every Friday 4d.

the forerunner of all motoring journals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

High Stepping.

A correspondent writes: "Your contributor 'Ixion' may know a lot about motor cycles but he does not know much about fashions. In your issue for March 16th he talks about 'the dancer who has trodden his best girl's skirt off her waist'! Since when has it been necessary for a man to lift his feet more than 2ft. off the floor, even in modern dances?"

Pilots for London Tourists.

The Automobile Association has instituted arrangements whereby tourists and country members can be met in any part of London, or its outskirts, by competent pilots having an intimate knowledge of the Metropolis and London traffic conditions. The men will be available for guiding members' vehicles by the best routes, through or around London.

Piston Rings.

A recent lecture by Mr. G. Williams at the Foreman's Institute, Coventry, was not without interest. The subject of piston rings and their design was clearly expounded by the author, who is connected with the British Piston Ring Co., and therefore speaks with authority. Amongst the interesting points brought forward were the statements that the concentric internally hammered ring with scarf joint is at least the equal of any other type, and that there is no great advantage in high-ring pressures. On the subject of narrow rings, it was stated that this type was becoming increasingly popular on account of reduced friction and greater flexibility to counteract cylinder distortion. On the other hand, narrow rings were apt to wear more quickly. Interesting lantern slides descriptive of manufacturing and testing machinery were shown, and a hint of new manufacturing methods in order to produce a perfect ring was given.

High Speeds in the U.S.A.

In our issue for March 10th we referred to records put up by Otto Walker at Fresno, California, U.S.A., on a Harley-Davidson. We have now received further particulars of his performances.

The time for the mile was 33.4s. (107.78 m.p.h.); for 10 miles, 5m. 48s. (103.44 m.p.h.); 15 miles, 8m. 37⅖s. (104.37 m.p.h.); and 50 miles, 29m. 34⅘s. (101.43 m.p.h.).

The times were made on February 22nd on a circular board track. They have already been recognised by the Motor Cycle and Allied Trades Association of America as American records, and such as are eligible will come up for confirmation before the International Federation of Motor Cycle Clubs at the next meeting at Geneva. It seems, however, that only the ten miles record can qualify as a world's record

Over the Cotswolds for the Victory Cup

Rising Sun was the rendezvous of a large number of motorists to witness the ascent of competitors in the trial. B. Bladder (8 New Imperial sc.) making a steady climb.

Over 170 Starters in the A.C.U. Midland Centre's Second Trial. 144 Finishers.

THE Cotswold District—once so formidable even to high powered machines—loses its value as a testing ground for modern motor cycles. This was proved by last Saturday's Victory Cup Trial, when a little 2¼ h.p. Velocette sidecar outfit did all that was required to qualify for an award.

Although such hills as The Beacon, Old Wyche, Portway, Birdlip, Rising Sun, Sudeley, and Willersey were included in the 128 miles course, to the great majority of the 170 odd competitors it was a joy ride, and few will retain memories of incidents with which to harry the souls of next year's novices.

Because the day was fine, at least until the worst was over, every hill was in good condition. Sir Herbert Austin, K.B.E. (one of the pioneers of the motor industry), started the first dozen or so pairs of competitors. Beacon Hill, a mile or so from the start, and in the first non-stop section, did not take its usual toll, but L. A. Bees (Beardmore-Precision) was unlucky and suffered from a choked jet. The next twenty-five miles were over main roads to Malvern, where the Old Wyche was climbed with almost unfailing regularity.

H. A. Pattman (4 Norton sc.) was the first to arrive, and, for some reason, failed, as he did later on Portway. He seemed dogged by ill luck from the start, where he suffered tyre troubles, and eventually retired in disgust. The other Nortons, however, more than made up for the deficiency. T. F. Watson and C. Wilson were very sure, and F. J. Adams, J. R. Fellows, and L. Paynter ascended the hill so fast that they were compelled to cut out.

A watersplash on the Colonial section. J. L. Hardy on his 3½ Triumph makes light of this obstacle.

On this hill the performances generally were consistently good. The solo Triumphs and Sunbeams, like the Nortons, might have been practising for the T.T. Let us whisper it, it is said that the speed of de la Haye's Sunbeam was 45 m.p.h. before it became necessary to cut out. Of the sidecars, most of the 5-6 h.p. James outfits were exceptionally fast, but H. Rem Fowler—once more in the competition game after a lapse of many years—barely got up without assistance. F. Arbuckle found the hill too much for his 4½ h.p. Humber sidecar, yet Sam Wright, on a sister mount, simply played with it. Tessier's Bat sidecar behaved as all big twin outfits should, and the spectators were treated to some steady unostentatious climbs by such riders as Hugh Gibson (8 Royal Ruby sc.) and W. A. Fell-Smith (8 Rex sc.).

Portway.

After seeing some seventy competitors on the Old Wyche with only three failures, we hurried on to Portway, thirty-two miles further on, but here, again, the officials were yawning in boredom with having nothing more to do than record the successes. Lightweights and heavyweights alike were taken up the hill, fast or slow as their riders willed. Yet Portway is a hill the

The Victory Cup.—

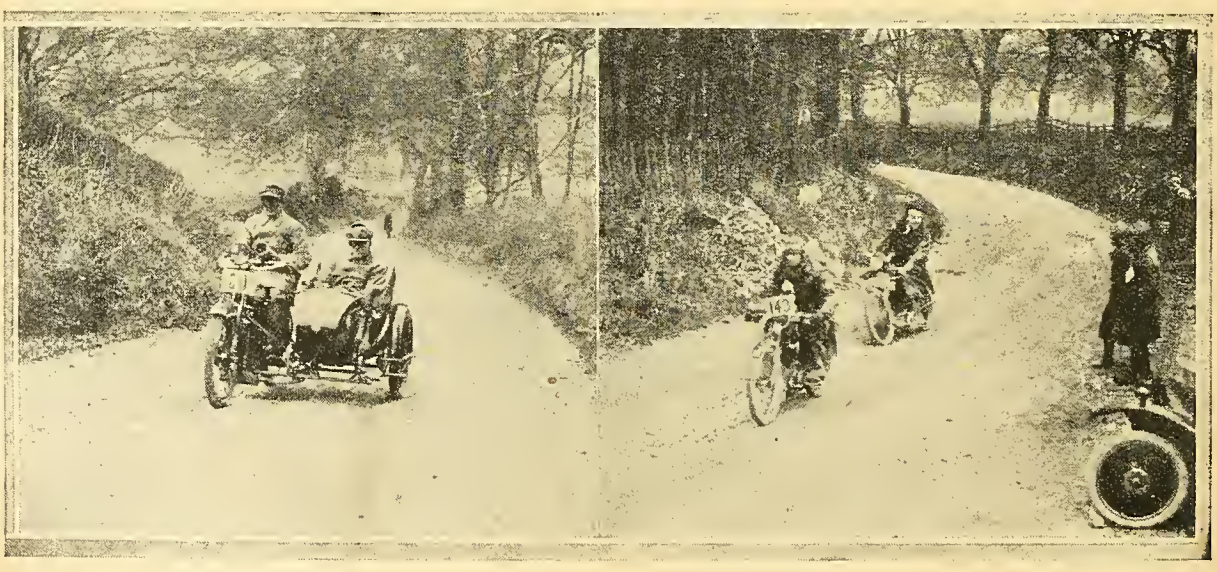
average owner would think twice before attempting. Some of the competitors ascended with one hand in pocket and smoking a pipe, so sure were they of themselves and their machines. How different it would have been had the surface been wet. Of the hundred competitors we saw ascend the hill, we recorded only two failures. S. H. Brand (4 Indian Scout) made a very fine ascent, while E. Walker, on one of the experimental 2¼ h.p. two-stroke Excelsiors, hummed up in great style. The Triumph sidecars driven by H. Finch and R. R. Grindlay also made splendid ascents, as did the Ariels, Nortons, and Sunbeams among the heavier weights, and the New Hudsons, Levises, Hobart, Sun, New Imperials, Verus, and O.K. among the lightweights.

Again, de la Haye got in a little practice for the T.T., and some of the B.S.A. solos, too, were particularly fast. The 2¾ h.p. Coulson sidecar driven by H. Guy made a very steady climb, and the power of Denley's little Velocette outfit was one of the features of the day.

Birdlip.

Another few miles and the competitors were on Birdlip Hill, which was in excellent condition. The spot chosen for the acceleration test consisted of a stretch, approximately 120 yards long, extending over the Nap, the worst section in the middle of the hill. Each machine was stopped and restarted on the gradient, and it was very noticeable that such machines as were equipped with handlebar controlled clutches scored considerably over the few with foot controls.

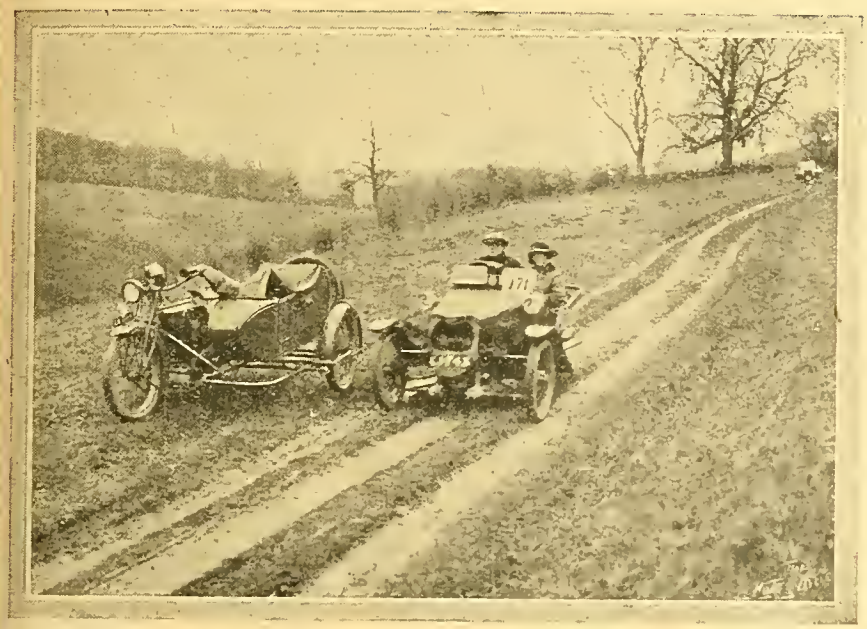
G. S. Arter (5-6 James sc.), the first man to arrive, got away very well, and amongst other early arrivals, R. B. Clark (2¾ Coulson), W. Swiffen (3½ Norton), G. Baragwanath (3½ Sunbeam), R. Brown (3½ Sunbeam sc.), F. Adam (3½ Norton sc.), B. Kershaw (2¾ Verus), and H. Newey (2¼ Levis) shone in particular.



Public interest in motor cycle trials is as keen as ever this year. This scene on the Old Wyche, Malvern, shows spectators very busy checking each competitor as he arrives. The rider is K. G. Hay, on a Coulson-B.

Hugh Gibson (8 Royal Ruby sc.) had trouble with a stretched clutch control and stopped his engine. De la Haye (3½ Sunbeam) shot off the mark like a rocket, and E. Williams (T.T. Sunbeam) dry skidded, such was his acceleration. Greenwood *père et fils* both went off the mark well—in fact, the Sunbeams and Nortons were good almost without exception.

B. H. Norris (2¾ Sun), W. Handley (2½ O.K.), C. Hall (2¼ Levis), L. Clulee (2½ Allon), P. Pike (2¼ Levis), H. Greaves (3½ Beardmore-Precision), C. Hanwell (2¾ Cedos), R. G. Mundy (2¼ Cedos), G. Denley (2¼ Velocette sc.), and G. Kuhn (2¼ Verus) were all stars amongst the lightweights.



Of the heavier classes, besides those already mentioned, the following deserve special praise: F. Brown (8 Rex sc.), A. Jacobs (5-6 New Imperial), S. Brand (Indian Scout), F. Hallam (8 Excelsior

On Portway. S. T. Tessier (8 Bat sc.), who made his first appearance in a public trial after eight years' retirement.

C. N. Green (4 Triumph) and R. C. Bennett (2¾ Federation) making light of Sudeley Hill.

cC

H. F. S. Morgan (8 Morgan) negotiating the grass-grown track which formed part of the "colonial" section.

sc.), B. L. Bird (4¼ B.S.A. sc.), A. Ellison (8 Zenith), A. Elliot (5-6 Rover sc.), J. Walker (4¼ B.S.A.), W. Chapman (7 A.J.S. sc.), S. Rhodes (2¾ Wolf), W. Woodcock (3½ Ariel), D. S. Heather (6 B.S.A. sc.), J. W. Wills (3¾ Scott), and, as in the Colmore Cup Trial, all the 5-6 h.p. Rover sidecar outfits without exception.

Some Cycle Car Performances.

Of the cycle cars, but for the fact that J. Meredith (10 T.B.) had the misfortune to stop his engine, all made good performances, though H. F. S. Morgan (8 Morgan) and the two G.N.'s appeared faster than the rest. At the conclusion of the test, we were informed that the following had completed the distance in under 15s.: B. Kershaw (2¾ Verus), T. C. de la Haye (3½ Sunbeam), T. C. Greenwood (3½ Sunbeam), and W. Swiffen (3½ Norton).

Rising Sun.

As on the hills in the morning section, so was it on Rising Sun in the afternoon—an almost unbroken series of clean ascents. Once more de la Haye made the star performance. It is doubtful whether such high speeds have ever been seen on Rising Sun; one after another they came up out of the bottom of the valley on to the top of Cleeve Cloud. All who were successful made good climbs, and quite a large number were out for spectacular display, for here, as usual, a very large crowd had assembled. Neck-and-neck races were quite common, and not always confined to pairs.

The Rover sidecars toured up in a bunch. W. Brandish (5-6 Rover solo) made a fast ascent over a zigzag course, showing that the hill was not unknown to him. P. Pike (Levis) was fast, as was G. Kuhn (Verus), the O.K.'s, and 2¾ h.p. Excelsior.

Not a few demonstrated how steadily and surely they could ascend, and some of the Triumph, B.S.A., and Norton solo mounts were conspicuous in this respect. S. Hall (3½ Sunbeam) made a very good climb, but, right on the summit, his gear jumped out, and, on getting into gear, charged the hedge.

On Sudeley.

As the procession wended its way up Sudeley rain began to fall. The majority took the hill steadily, and there was little incident to recall. A mild excitement was caused by a chimney fire in an adjacent house, which was offset by the failure of G. White (5-6 Rover sc.). His machine had gone beautifully up to this moment, but for some unknown reason became tired on this very moderate climb. The silence of the Humber team was perhaps the most noticeable feature, combined with a star ascent by E. Williams and the fast climbs put up by the Sun, Verus, and Velocette two-strokes.

After Sudeley came a rough colonial section with a deep watersplash, where the all-chain drive machines had the advantage; then homeward, *via* Willersey Hill and main roads to Rose Hill, in the rain. Just before Broadway, Fell-Smith (8 Rex sc.) took a corner too fast, and turned over. This accident induced Gibbons, on a sister machine, to retire to give assistance.

Throughout the run the organisation was splendidly carried out, and reflected great credit upon the organisers, the Birmingham M.C.C. At all points of interest there was a plentiful supply of programmes containing the list of entrants, so that spectators were able to take an intelligent interest in the performances, instead of merely watching a nameless string of competitors go by.

SURVIVORS IN SATURDAY'S VICTORY CUP TRIAL.

G. S. Arter (5-6 James sc.).

Speed Hill-climbing on "Grease."

Stockport Open Hill-climb on Axe Edge curtailed by Rain.

G. Dance (2¾ Sunbeam) streaking up Axe Edge in last Saturday's Open Hill-climb organised by the Stockport M.C. Rain curtailed the programme, which included over two hundred entries.

AXE Edge, two miles from Buxton, the venue of last Saturday's Stockport and District Motor Club's open hill-climb, permits high speeds; and with an entry of 216, and riders such as G. Dance, V. Horsman, N. C. Sclater, H. R. Davies, and many others of note, a good deal of sport was expected.

The first event was for 350 c.c. sidecars; then came 500 c.c. sidecars, with keen competition between the Norton and Sunbeam riders. G. Dance (Sunbeam), and H. W. Hassall, G. W. Walker, and Horsman (Norton) put up some fine rides.

The 750 c.c., 1,000 c.c., and unlimited sidecar classes were run off in a prompt manner without mishap.

Just as the 250 solo class started a sharp shower made the road rather tricky and nasty for the riders without mudguards. J. Prestwich (2¼ J.A.P.) made a fine ascent. The efforts of some of the other riders seemed feeble, no doubt owing to the heavy going, for it had now started to rain heavily. In the 350 c.c. solo class G. S. Boston (2¾ A.J.S.) streaked up the hill, but wobbled, ran on the grass, then back on to the crown of the road, across the road again into the grass on the other side, and finally parted company with his mount.

Rain.

The rest of the class got up without mishap, but gave the spectators many thrills on the wet limestone roads. Dance went up without a swerve, and cutting out on the bend only, he made a hair-raising performance. The pouring rain gave the officials some anxious moments when the 500 c.c. solo class was started. The men lined up and watched H. W. Hassall (3½ Norton) plough through the wet and mud; he was the last to ride, for the rest of the programme was washed out.

One of the first to vanish was the official A.C.U. timekeeper, so no times were available. The hard-working officials had the bitterest of luck. The event was splendidly organised, a large tent for refreshments had been erected, and there were field kitchens which had been brought from Stockport for the comfort of all concerned.

A SOUTHERN HILL-CLIMB.

BORE Hill, Dorking, was the scene of a speed hill-climb, organised by the Wallington and D.M.C. and L.C.C. on Saturday last. There was a large number of spectators, and a fair number of entries, but the 275 c.c. and 350 c.c. classes were weak.

In Class 1 (275 c.c.) G. H. Symonds performed by himself on an extremely speedy Levis, making the ascent at 28.39 m.p.h. Fastest time of the day was made by R. A. Green on a 3½ h.p. Norton, who made the ascent at 50.44 m.p.h. A. O. Gruzelier, who was unable to obtain his Bradshaw-Zenith in time, rode an 8 h.p. Zenith instead. The results were as follows:

CLASS 1 (275 c.c.).—1, G. H. Symonds (2¼ Levis).

CLASS 2 (350 cc.).—1, G. H. Symonds (2¼ Levis), 52⅖s., 28.39 m.p.h.

CLASS 3 (500 c.c.).—1, R. A. Green (3½ Norton), 31⅗s., 47.25 m.p.h.; 2, C. M. Bowen (3½ Norton), 33⅕s.; 3, W. H. Sheraton (3½ Norton), 34s.

CLASS 4 (750 c.c.).—1, R. A. Green (3½ Norton), 30s., 49.77 m.p.h.; 2, W. H. Sheraton (3½ Norton), 33⅕s.; 3, C. M. Bowen (3½ Norton), 33⅘s.

CLASS 5 (1,000 c.c., Solo).—1, R. A. Green (3½ Norton), 29⅗s., 50.44 m.p.h.; 2, W. H. Sheraton (3½ Norton), 32⅗s.; 3, A. O. Gruzelier (8 Zenith), 32⅘s.

CLASS 6 (1,000 c.c., Sidecars).—1, A. O. Gruzelier (8 Zenith sc.), 49s., 30.48 m.p.h.; 2, J. C. Sanford (5 Rover sc.), 54⅘s.).

FRENCH TRIAL.

OWING to Customs difficulties, the organisers of the Paris-Madrid trial find that they are unable to adhere to their original programme, and, consequently, they have altered the title of the competition to the Paris to the Pyrenees trial.

It is a great pity that the run through Spain could not be proceeded with, as this undoubtedly made the prospects of the competition exceedingly attractive. As it is, however, the new route decided upon from Paris to the Pyrenees, through Pau, Tarbes, and over the passes of the Pyrenees to Toulouse, Montauban, Agen, Bordeaux, and back to Paris by the Loire, should take the competitors over some of the most difficult country in France, while the passes of the Pyrenees should provide ample opportunities for hill-climbing.

LOWER PRICES.

ALTHOUGH price reductions are not so numerous as to lead one to suppose that all makes are coming down, every week sees some interesting announcement in this respect. This week we are able to record the following price adjustments:

Coventry Acme.—8 h.p. outfit, chain drive, with spare wheel, hood, screen, etc., from £225 15s. to £190.

P.V.—Spring frame, Villiers engine, Burman two-speed, £75; with clutch and kick-starter, £80 (lady's model, £81); with Jap engine, £84, £89, and £90.

B.S.A.—6-7 h.p. twin from £150 to £133.

Ariel.—3½ h.p. solo, £110; sidecar, £147 10s. 6-7 h.p., chain-cum-belt, £130; sidecar, £167 10s. 4½ h.p. all-chain model, £120; sidecar, £162 10s. 6-7 h.p. all-chain, £135; sidecar, £177 10s.

Rudge.—Multi models: 3½ h.p., £85; 5-6 h.p. (with sidecar), £125; 7-9 h.p. (with sidecar), £155. Three-speed models: 3½ h.p., £125; 5-6 h.p., £135 10s.; 7-9 h.p., £167; sidecar, £42.

Club News

Carmarthen M.C. and L.C.C.

On Good Friday the club will hold its annual hill-climb at Golden Grove Hill.

Brookdale M.C.C. (Catford).

Considerable success has already met the revival of this club, and it has been decided again to affiliate to the A.C.U.

Colne and District M.C.C.

Only formed last month, this club has already over fifty members. Mr. F. Mercer, Lancshawbridge, Colne, is the secretary.

Biggleswade and District M.C.

Rules permitting and encouraging lady members were passed at a meeting of this newly formed club. An opening run is to be held on Good Friday.

East Lancashire M.C.C.

At a meeting on the 10th inst. it was decided to enter one or more teams in the forthcoming reliability trial of the North-Western Centre A.C.U., and also to arrange the club's trial for the Hornby cup on Good Friday to Ingleton and back.

Norfolk M.C. and L.C.C.

At the annual general meeting it was decided to divide the new secretariat into two, *i.e.*, an honorary general secretary and an honorary competitions secretary. Mr. R. A. Lower, of Mount Pleasant, Lower Hellesdon, near Norwich, now holds the former position, and Mr. R. O. Clarke the latter.

Surbiton and District M.C.C.

Over 150 members met at Ditton Green, Thames Ditton, for the opening run, and with the captain, Mr. F. W. Barnes, leading the club, made for "Deepdene," Dorking. Tea was served in a private room, where they met several members of the M.C.C. on their return from their opening run to Brighton, bringing their numbers up to nearly 200.

North London M.C.C.

The find-your-way competition held on the 12th inst. involved finding the shortest route from place to place and proceeding by it to a schedule time. Maps were not allowed. Mr. E. K. Jeffrey (4 Triumph) passed through all the controls and arrived at the final destination exactly to time, thereby earning the medal.

Ealing and District M.C.C.

A large number of members and guests spent a most enjoyable evening on Thursday, March 10th, at the Red Lion Hotel, Acton Hill, London, W., when the Ealing and District Motor Cycle Club held its annual dinner and prize presentation. Dr. A. M. Low, the president, was in the chair.

Forthcoming Club Events.

Mar. 25.—East Lancashire M.C.C. Hornby Cup Trial.
Mar. 25.—Harley-Davidson M.C.C. Opening Run.
Mar. 25.—North West London M.C.C. Easter Tour.
Mar. 25.—Biggleswade and District M.C. Opening Run.
Mar. 25.—Carmarthen M.C. and L.C.C. Hill-climb.
Mar. 25.—Eastern Valleys M.C.C. Opening Run.
Mar. 25.—Dewsbury and District M.C.C. Picnic.
Mar. 26.—Leeds and District M.C. Social Run.
Mar. 26.—Birmingham M.C.C. Saugster Cup Trial.
Mar. 26.—West Kent M.C.C. Acceleration Test.
Mar. 26-28.—Glasgow Western M.C.C. Week-end Trial.
Mar. 27.—Neath and District M.C.C. Reliability Trial.
Mar. 27.—West Bromwich M.C.C. Reliability Trial.
Mar. 27.—North Western Centre, A.C.U. Rally at Ribchester.
Mar. 28.—Northern M.C. Social Run.
Mar. 28.—North London M.C.C. Staley Cup Trial.
Mar. 28.—Rugeley and District A.C. Speed Trials.
Mar. 28.—Brighton and Hove M.C.C. Hill-climb.
Mar. 28.—Dewsbury and District M.C.C. Hill-climb.
Mar. 28.—Berwick and District M.C.C. Opening Run.
Mar. 30.—Bournemouth and District M.C. and L.C.C. Spring Rally.

IMPORTANT club and OPEN events are tabulated on the "Questions and Replies" page.

Marloe and District M.C.C.

Although the weather was showery, a very enjoyable afternoon was spent on the occasion of the opening run on the 13th inst. The honorary secretary is Mr. A. F. H. Baldry, Marloe Common, Bucks.

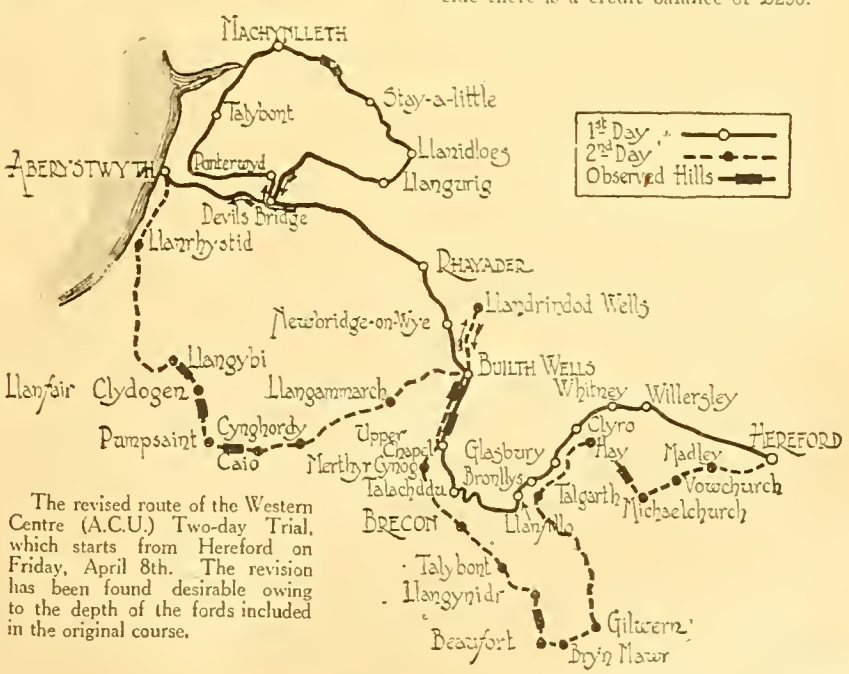
North-west London M.C.C.

An Easter tour on purely social lines, and with Eastbourne as a centre, is proposed by the club. Already a small number of members have signified their willingness to join in.

Coventry (Triangle) M.C.

A very successful evening in the form of a smoking concert was held on the 10th inst.

Stalybridge and District M.C.



Before a large number of members at the annual general meeting the various club officials were elected, and the annual subscription was raised to 10s. 6d. for gentlemen. Lady members are still welcomed at 5s.

Barnstaple and District M.C.C.

A club bearing this title has recently been formed at Barnstaple, twenty-five members being enrolled at the opening meeting. Application for membership should be made to Mr. H. J. Hill, 10, High Street, Barnstaple, North Devon.

Bradford M.C. and L.C.C.

The annual general meeting was held on Thursday, the 10th inst., and was fairly well attended. All the present officials were unanimously re-elected. The club has over 300 members, and a very strong committee has been formed to supervise a very active season. On the financial side there is a credit balance of £290.

The revised route of the Western Centre (A.C.U.) Two-day Trial, which starts from Hereford on Friday, April 8th. The revision has been found desirable owing to the depth of the fords included in the original course.

Club News.—

Bury and District M.C.

There was a fairly good attendance at the opening meet, which was held at Hodder Bridge on the 6th inst.

Plymouth and District M.C. and L.C.C.

Over a course which included five of the worst hills on Dartmoor, eight out of twenty entrants finished the trial for the R.N.E. College Cup. Results: 1, Lieut. C. W. Jameson (3½ Sporting Sunbeam); 2, C. B. Endicott (3 A.B.C.); 3, J. Baker (3½ Sunbeam).

Another Club for Warrington.

As the existing club has decided to cater purely for the sporting rider, the late secretary, Mr. H. Aldred, is forming another club more on the social side of the pastime. Any interested should communicate with him at 58, Church Street, Warrington.

Bath and West of England M.C.

In aid of the funds of the Royal United Hospital, Bath, a dance will be held in the Pump Room on 21st April. Among the prizes are a new 4 h.p. Douglas and silver tea service. Tickets (1s.) for these awards may be obtained from Mr. J. C. Young, Somerset Boys' Home, Bath.

Bristol M.C.C.

On Saturday, 12th inst., the club carried out an interesting programme of speed events over a very fast course. Quite a crowd of Bristol enthusiasts were rewarded with some very keen tussles in the various classes. The results were as follows:

350 c.c. CLASS.—1, R. Passey (2¾ Douglas); 2, Eli Clark, junr. (2¾ Douglas).
500 c.c. CLASS.—1, H. Thorpe (3½ Douglas); 2, R. Passey (2¾ Douglas).
UNLIMITED CLASS.—1, King Smith (7-9 Harley-Davidson); 2, H. Thorpe (3½ Douglas).
500 c.c. SIDECAR CLASS.—1, B. Tucker (3½ Norton sc.); 2, A. Dyer (3 A.B.C. sc.).
UNLIMITED SIDECAR CLASS.—1, B. Tucker (3½ Norton sc.); 2, A. Mann (7-9 Harley-Davidson sc.).

MOTOR CYCLE EVENTS AT BROOKLANDS.

Sat., April 16.—B.M.C.R.C. (Members).
Sat., May 7.—B.M.C.R.C. (Open).
Sat., May 21.—B.M.C.R.C. (Members).
Sat., July 2.—B.M.C.R.C. (Members).
Sat., July 29.—B.M.C.R.C. (Members).
Sat., Aug. 6.—B.M.C.R.C. (Open).
Sat., Aug. 27.—B.M.C.R.C. (Members).
Sat., Sept. 17.—B.M.C.R.C. (Members).
Sat., Oct. 8.—B.M.C.R.C. (Members).

Nottingham M.C. and L.C.C.

Varying subscription rates, ranging from 7s. 6d. to £1 1s., for social or sporting membership, were adopted at the recent general meeting, held at the Walbeck Hotel.

South-Eastern Centre A.C.U.

On Thursday, the 31st inst., a meeting of representatives from clubs in Kent, Surrey, and Sussex will be held at the Royal Automobile Club in order to proceed with the formation of a South-Eastern centre. It is urged that all clubs in these counties should attend, whether at present affiliated to the A.C.U. or not.

Portsmouth and District L.C. and M.C.C.

The Portsmouth branch of the N.M.C.F.U. has now been formed into a local club under the title of the Portsmouth and District L.C. and M.C.C., and an opening run will be held on March 25th. The hon. secretary is Mr. F. G. Roach, 1, Empshott Road, Southsea.

Lincolnshire A.C.

Open speed trials of the Lincolnshire A.C., to be held at Grimsthorpe Park, near Bourne, on Easter Monday, promise to outrival the last held at Chatsworth Park. All the clubs from the adjoining counties are arranging club runs to witness the event, while several clubs from far afield have given notice of their intention of attending. The track is in splendid condition, and the lowering of all local times is predicted, as a number of well-known riders have entered.

Helensburgh M.C.C.

This Northern club has just drawn up a most attractive programme for 1921, particulars of which may be obtained from the secretary, Mr. J. F. Fulton, Findhorn, Helensburgh.

Northern M.C.

On Wednesday, the 9th inst., the closing lecture of the winter session of the Northern Motor Club was given by Mr. G. Dixon, a club member, on "Wireless Telegraphy," in the Crow's Nest Hotel, Newcastle-on-Tyne.

West Bromwich M.C.C.

Formed only a month ago this club already possesses a membership of fifty. Particulars may be obtained from the hon. sec., Mr. J. C. Holdship, Clifton House, Hope Street, West Bromwich.

Dunheved and District M.C.

The annual meeting of the Dunheved (Launceston) and District M.C. was a great success. The president (Mr. F. A. Bate) was in the chair. The treasurer (Mr. A. H. Grigg) reported a balance in hand of £8.

West Fife M.C.

An excellent attendance and the enthusiasm displayed by the members at the second annual meeting on the 14th inst. indicate the promise of a very successful year. Handsome silver cups were presented by Mr. P. T. Bonner and Capt. W. F. How.

Yorkshire Centre A.C.U.

A meeting of the Centre was held at the Hotel Metropole, Leeds, on Monday, March 7th, and twenty of the twenty-two clubs were represented, altogether forty-three (including officials) being present. The Centre speed event, allotted to Middlesbrough, will take place on Saltburn Sands on July 9th, and not, as provisionally fixed, on August 6th.

PRICES OF SECOND-HAND MOTOR CYCLES.

A Schedule of Prices at which used and shop-soiled Motor Cycles were being offered in the miscellaneous advertisements of last week's issue of "The Motor Cycle."

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

OILING ENGINE AND GEAR BOX.

(1.) Can you inform me how often to give a pumpful of oil to my 1919 (early) 4 h.p. Triumph, both as solo and with sidecar? (2.) What brand and grade of oil do you recommend for the Sturmey-Archer gear box, and how often should it be replenished? (3.) What is the correct sized jet and correct level in the carburetter for the use of benzole instead of petrol? How is the level altered? A Triumph carburetter is fitted with jet No. 28.—F.

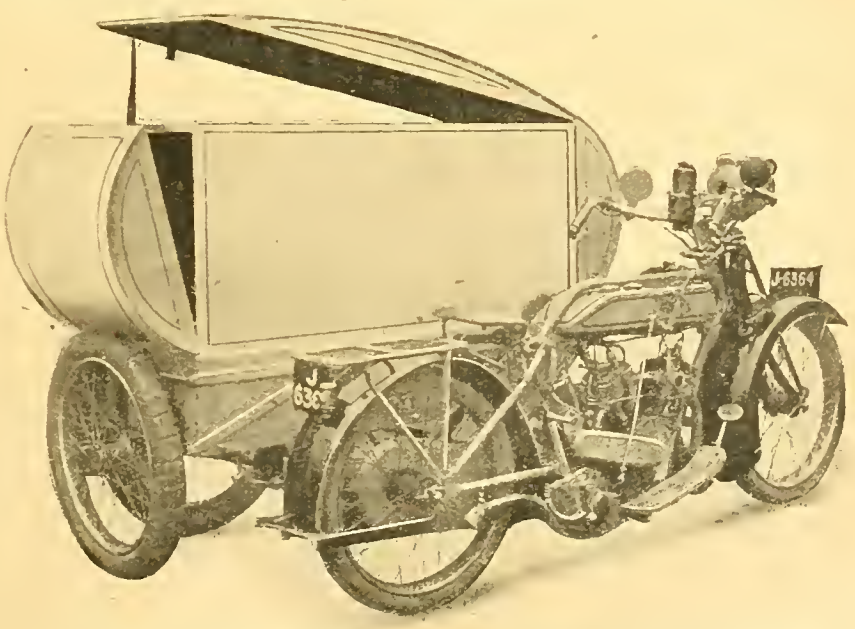
(1.) About every eight miles solo, or six with sidecar. Much depends upon average speed, road conditions, head winds, etc. Experience will be your best guide. (2.) Engine oil or that supplied by the makers should be used. If the box is empty, half a pint should be used. (3.) The same size jet will be quite suitable, but it may be necessary slightly to lower the petrol level. This is done by lowering the collar on the float needle to the required amount, about $\frac{1}{32}$in.

INTERMITTENT MISFIRING.

When travelling at a fairly high speed my engine suddenly stopped, and although I kicked for over half an hour I could not start it, so I had to push three miles home. The spark was very weak, so I took the magneto (a Bosch) off the machine and examined the points and brushes, which were quite in good order, and on replacing them I got a very healthy spark. The same thing occurred again, and the same remedy acted; then it suddenly ceased firing and started again with the first kick. After this had happened a few times, I kept the clutch engaged whenever the engine stopped, and sometimes it started firing again before the machine came to a standstill. On other occasions it would not recommence firing until I used the kick-starter.—L.L.S.

It is very doubtful if the trouble you describe is due to a defect of the magneto; indeed, we should imagine, from the symptoms you mention, that it is more likely to be a case of the jet being temporarily obstructed by a floating particle of grit. Dismantle the carburetter and thoroughly clean out the float chamber and jet. If after doing this, you still think that the cause of the trouble lies in the magneto, remove the high-tension carbon brush holder, and clean the slip ring by inserting a piece of rag soaked in petrol, rotating the magneto meanwhile. Also make quite sure that the contact breaker points do not remain temporarily open.

POOR RUNNING AFTER REBUSHING.



A month or so ago the makers overhauled my 2½ h.p. two-stroke engine, in which the crankshaft bushes were worn; also, the gears received attention. For a time the engine would not answer to the throttle, but now it does so on the level road. The hills which it previously climbed (two up) on half throttle on top gear it will now only just climb on top gear and full throttle with myself alone. Before being overhauled I used the drip feed for the oil, and no oil with the petrol, with a No. 24 jet (Amac). Now I am using the drip feed and also petroil feed with the same size jet. The timing, I believe, is correct, piston at dead top of its stroke, spark lever fully retarded, and points not quite breaking; but I find out that when running with the spark fully advanced and the machine begins to slow down that retarding gives an increase of speed.—A.D.

It is usual for an engine to lack liveliness immediately after overhauling, especially in the case of one fitted with plain bushes. We think that after a little "running in" you will find that the power will return—in fact, this appears to be taking place already, judging from your description of its running. The timing appears to be correct; but if you find that you get an increase of speed when you slightly retard the spark it would be perhaps advisable permanently to retard the timing very slightly. Set it as follows: Piston top dead centre, control lever fully retarded, contact breaker points just about to break.

COMPARING ACETYLENE AND ELECTRICITY.

Will a 4 c.p. electric bulb give as good a light as a 14 litre acetylene burner, using an ordinary acetylene lamp in both cases with an adapter for the bulb, assuming the light in both cases to be focussed to the best advantage?—R.H.

We cannot give you a figure which will help you to compare the lighting intensity of an acetylene burner with that of an electric bulb, as everything depends upon the efficiency of the reflector in use. The 4 c.p. electric bulb would not give nearly such a satisfactory light as the 14 litre acetylene burner used in an ordinary acetylene head lamp, but might be equally effective in a specially designed electric lamp.

The proportions of this sidecarrier, marketed by the Jarrow Motor Cycle Co., should meet with the approval of traders desirous of a vehicle capable of carrying bulky parcels economically and swiftly. The machine is a 5-6 h.p. Clyno.

AN UNINTENTIONAL MISREPRESENTATION.

Last year I bought a motor cycle as a 1918 machine; it was a good one. I kept it for a month, and then a fellow workman worried me into selling it to him. I sold it to him, believing it to be as I bought it. He has ridden it nine or ten months, and has now sold it. The man he sold the machine to has had it a month or so. He now asserts that the machine is a 1914, and also claims £5 from the seller for misrepresentation. The seller now asks what I am prepared to do in the matter. Am I liable in any way, as he did not make any effort to verify when it was in his possession, and it is now ten months since I sold it?—F.W.U.

As there was apparently unintentional misrepresentation of the date of the machine on your part, the seller would have very great difficulty in enforcing a claim for a return of any part of the purchase price. We should advise you to admit no responsibility in the matter.

GEAR ADJUSTMENT.

I am experiencing trouble with my three-speed gear box, and trust that you will kindly be able to assist me in overcoming it. It is the ordinary gear box, dogs for top and bottom gears, and toothed wheel for middle gear. The trouble is that I cannot always get free engine without having to bring the gear lever slightly back towards the low gear, showing that when free the sliding wheel is not clearing the toothed wheel which operates second gear. I have tried to adjust this by meshing dogs of low gear and tightening up control accordingly, but find that I am robbing the top gear and cannot get the dogs to mesh beyond just a touch. The same thing operates if I adjust from the top gear; I cannot get into bottom gear. What puzzles me most is that it is not always so. Sometimes I have no difficulty whatever, but perhaps before I get back home I am up against it again. I may say there is no play whatever between the gear lever and the down control rod. The outfit was only delivered last August, and I have not yet done 1,000 miles, so I hardly think it was owing to wear.—H.R.

Without actual inspection, we cannot give any definite reason for the trouble. It may, however, be due to excessive play of the various parts in the gear box, or be caused by whip of the striking fork.

TIMING A TWIN.

Having obtained some new cams, and wishing to fit these myself, I would like to know how to go about timing the valves. The machine in question is a 1913 or 1914 6 h.p. Clyno, with a Bosch magneto 55°.—E.G.

If the new cams have been supplied by the makers, the timing of the engine will be quite simple. You need not consider the opening point of the exhaust valve or the closing point of the inlet valve. All you have to do is to rotate the engine until the piston of the front cylinder is at the top of its stroke; then insert the corresponding cam wheel, so that the exhaust valve is just closing and the inlet valve just commencing to open; then rotate the engine through one full revolution less the angle between the cylinders, and time the other cylinder in the same manner. The ignition should be timed to occur on top dead centre of compression stroke, when the control is two-thirds retarded.

A VAGUE TROUBLE.

A 3½ h.p. single which I have just overhauled will run well on the stand, but on the road it seems to have no life or kick. The carburetter is a Senspray with a 36 jet, and I think that it is in order. The magneto is a Ruthardt, and on turning the pedal and holding the bare wire I get a good shock and then a smaller one alternately. I have washed the points with petrol, but it is still the same.—H.L.B.

Without actual inspection, it is very difficult to define the cause of the trouble. We take it that you have assured yourself that the compression is reasonably good, that the piston and cylinder are free from carbon deposit, and that the valve seatings are in good condition. The lack of power might also be due to excessive clearance between the exhaust valve and its tappet. Probably a 38 jet would give you slightly more power. Regarding the magneto, you have not stated whether you get a good spark at the plug points. If you do get a satisfactory spark you may assume the magneto to be in good order.

Important Dates.

Fri., March 25th—Richmond Meet.

Fri., March 25th, and Sat., March 26th—M.C.C. London-Land's End Trial.

Mon., Mar. 28th—Westmorland M.C.C. Open Hill Climb.

GOVERNMENT SURPLUS

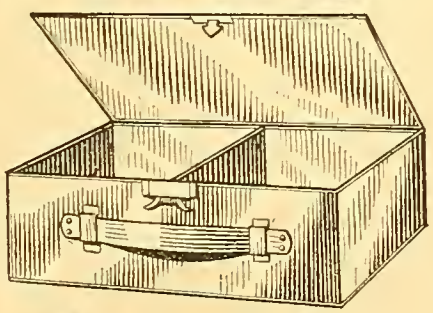
STEEL CASES

These cases are ideally suited to the requirements of all motorists, mechanics, and engineers, for storing spare parts, tools, etc. Also for the use of picnic parties and tourists.

They are exceptionally strong, being made of about 24 gauge steel with wired edges, painted black inside and outside, with partition in centre, leather strap handle, and automatic catch.

Made to Ministry of Munitions specifications, and intended as Lewis Gun Magazine Carriers.

Inside measurements 18¾in. long × 9¼in. broad :: 6½in. deep.



Estimated cost about 40/- each to make. Secure some at once, as we have only a limited number for disposal.

Send your order at once, and enclose Cheque or Postal Order (Treasury Notes and Coin must be registered) to:

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words e charged double rate. Each paragraph is arged separately. Name and address must counted. Series discounts, conditions, and ecial terms to regular trade advertisers will quoted on application.

Postal Orders and Cheques sent in payment for vertisements should be made payable ____ & Co. ILIFFE & SONS Ltd., and crossed ____ easury Notes, being untraceable if lost in ansit, should not be sent as remittances.

All advertisements in this section should be companied with remittance, and be addressed the offices of "The Motor Cycle," 20, Tudor reet, London, E.C.4, or 19, Hertford Street, ventry. To ensure insertion letters should posted in time to reach the offices of "The otor Cycle," by the first post on Friday orning previous to the day of issue.

All letters relating to advertisements should ote the number which is printed at the end of ch advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical printers' errors, although every care is taken avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be dressed to numbers at "The Motor Cycle" Office. en this is desired, the sum of 6d. to defray the cost of istration and to cover postage on replies must be added the advertisement charge, which must include the rds Box 000, c/o "The Motor Cycle." Only the number l appear in the advertisement. All replies should be dressed No. 000, c/o "Motor Cycle," 20, Tudor Street, .C.4. *Replies to Box Number advertisements containing illances should be sent by registered post, but in all such es it is advisable to make use of the Deposit System.*

n the case of motor cycles offered for sale under a box mber, as it is unusual for these to be sold without first ng inspected by the intending purchaser, advertisers will ilitate business by embodying in their advertisements he mention of the district in which the machine ered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons y deal in perfect safety by availing themselves of our posit System. If the money be deposited with "The tor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the ds is three days, and if a sale is effected we remit the ount to the seller, but, if not, we return the amount the depositor, and each party to the transaction pays ringe one way. For all transactions up to £10, a posit fee of 1/- is charged; on transactions over £10 under £50, the fee is 2/6; over £50 and under £75, 5/-; r £75 and under £100, 7/6; and on all transactions r £100, ½ %. All deposit matters are dealt with at Tudor Street, London, E.C.4, and cheques and money ers should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an ication that the advertiser is willing to avail himself of Deposit System. Other advertisers may be equally rous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no wer to their enquiries are requested to regard the nce as an indication that the goods advertised have ady been disposed of. Advertisers often receive so ny enquiries that it is quite impossible to reply to h one by post.

SPECIAL OFFER
OF
DOUGLAS
MOTOR CYCLES

Rebuilt as new from ex-Government machines and new parts.

Completely equipped with new accessories, including head lamp and generator, tail lamp, horn, licence holder, two toolbags, pump, and tool kit, and guaranteed 3 months.

Douglas 2¾ h.p., 2-sp., £65

Douglas 4 h.p., 3-sp., kick-start and clutch .. £85

Douglas 4 h.p. Combination, with new body, £105

Being the largest dealers in renovated Douglas motor cycles in the trade, and having large numbers on hand for disposal, we make the above offer for a short period, to endeavour to considerably reduce our stocks.

Each machine is rebuilt in our own workshops, stove-enamelled, replated, tanks renovated in makers' colours, fitted with new magneto, carburetter, tyres, front brake, etc., and complete with full equipment as above.

Each machine is absolutely guaranteed, and in appearance is practically indistinguishable from new.

In addition to the above, we have about 100 machines at a lower figure, each one overhauled, stove-enamelled, replated, tanks in makers' colours, good serviceable tyres, fitted with toolbag, kit, and pump. Guaranteed sound, good running machines.

Douglas 2¾ h.p. 2-sp., £55
Fully equipped £58.

Carriage extra in each case.

Trade Supplied.

Full particulars of Deferred Payment Terms on request.

SOUND ADVICE
ENSURES
SOUND VALUE

YEARS of experience and observation have taught us that the best motor cycles are always the cheapest in the end—BEST and cheapest because of the reliance one can always place on a quality machine, and the confidence and security assured under all road conditions. By supplying only the BEST motor cycles—those that after every possible test prove their worth—we have secured a large and ever-increasing clientele among motor cyclists of discernment. We realise also that practical experience is invaluable in knowing the good from the bad, and therefore no machine passes through our hands before its roadworthiness and efficiency are guaranteed by our staff of expert mechanics and riders; so by thus satisfying ourselves as to the quality and reliability of every machine we sell—we are confident of satisfying our clients.

We supply only the best makes, because by so doing we are living up to our business ideals of integrity and honesty of purpose, for on those ideals, as the foundation stone of our business, success has been built and to-day we have one of the largest and most successful motor cycle businesses in the United Kingdom. Complete and lasting satisfaction to our clients is guaranteed, for by giving satisfaction and honest service at all times, our many friendships have been created—friendships which are ever increasing, and which we value very greatly, far more, in fact, than the mere £ s. d. of business.

If you are thinking of purchasing a new or second-hand motor cycle, look us up, or write to us. We will give you the benefit of our experience and advice, and the fullest VALUE because we sell only the BEST.

1921 MODELS
New Machines in Stock

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

Don't Scrap an old Engine,

but give it a

NEW LEASE OF LIFE

by fitting the

World-famed Philipson Pulley.

Entirely Free from troublesome and weighty complications—only two working parts—no levers, rods, wheels, etc., to worry about. Simply takes the place of the ordinary pulley. One nut secures the complete gear to the engine. Can be fitted without any alterations to most direct belt-driven engines in a few minutes.

For hill-climbing it is unsurpassed. Makes mountaineering easy.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet.

During the past few weeks the following machines have been fitted with **PHILIPSON Pulley:**

Triumph,	**Arno,**

THE MOTOR CYCLE

Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

Dear Sirs,

I beg to thank you for yours of the 7th inst. with cheque enclosed in settlement of my claim for repairs to my Motor Cycle combination, and at the same time I also wish to thank you for your very prompt and kind attention that you have given to the whole business. It is a pleasure to do business with a real live concern, such as yours is.

Believe me,

Yours faithfully,

The only Safe Test of Insurance is Claims. We settle Claims promptly.

BIRMINGHAM

SOLE AGENCY

Showroom and Service Depot for

IVY MOTOR CYCLES

Certainly there is no better two-stroke; the "Ivy" was one of the original pioneer makes, and has never varied from a high standard of quality and reliability. Moreover, it always bears the distinctive marks of taste, technical knowledge, and "brains," in its design and finish.

THE IVY "THREE" is the leading model, a new conception in two-strokes, possessing the power and pull of a 3½ h.p., combined with the lightness, handiness, low cost, low upkeep, and low taxation (30/-) of a lightweight; it is an elegant machine for either sidecar or solo. It "two-strokes" at all speeds, due to correct engine design. The Ivy 2½ h.p. is another model, a dainty mount for solo only, and one well tested and proved over the years. Send for list showing all models and prices from £62 (2½ h.p. Solo) to £118 (3 h.p. Combination)

MOTOR CYCLES FOR HIRE.

MOTOR Cycles, solo, Saturday to Monday, 42/6, one week, 85/-; combination, 52/6 and 115/-; write for further information.—Maudes', 100, Gt. Portland St., W.1. [8160

MOTOR ATTACHMENTS.

WALL Auto-Wheel, in good condition; bargain, £8. —Cowley, Lechlade, Gloucestershire. [7759

YOUNG Attachment and Cycle, almost new, licensed; £26/10.—Thomson, 85, Church Rd., Willesden. [7669

AUTO-WHEEL, 1919, good order and condition; £12/10.—Thomson, 85, Church Rd., Willesden. [7668

SIMPLEX Motor Attachment, 1h.p., for pedal cycle, new; £23, or offer.—Barford, Denmark Rd., Kingston-on-Thames. [7138

YOUNG Cycle Attachment, fitted to makers' own special cycle, new, tax paid.—Wain, Cotton Rd., Potters Bar. [7144

WALL Auto-Wheel and Gent.'s Cycle for sale, 1½ h.p., 140 m.p.g., splendid condition; £22, offers. —Apply after 7 or Sat. 2-5, Horvath, 15, Stanhope Rd., Highgate, N.6. [7228

TRICYCLES FOR SALE.

ARGSON Hand and Motor-propelled Tricycles, for invalid and disabled.—Particulars, Argson Eng. Co., Ltd., 3, Kendalls Mews, George St., W.1. [2647

ARIEL Tricycle, 3h.p., water-cooled head, mag., B.B. carburetter, 2 speeds, free engine, easy starter, licensed.—Letters, A., 133, South Norwood Hill, South Norwood. [6689

TRICARS FOR SALE.

TRICAR, 5h.p. Chater-Lea, water-cooled, perfect condition; £60.—58a, Gosberton Rd., Balham, S.W.12. [7540

CENTAUR Tricar, 4h.p., 2 speeds, free engine, chain drive, suit tradesman, good order; £20, or nearest. —Hall, Astage, Windlesham, Surrey. [8020

THOMPSON Brothers 1920 Tricar, 3-speed and reverse, Stewart speedometer, 4 disc wheels, insurance, run 600 miles, running perfectly; £250.—Warren, Chemist, Wareham. [8248

MOTOR SCOOTERS.

SKOOTAMOTA, 1920 model, new and unused; £48.—Hopkins, New St., Ledbury. [0538

A.B.C. Skootamota, practically new; 28 gns.—Street, 9, Edge Hill, Plumstead. [7137

KINGSBURY Scooter, nearly new; £20.—Clifford's Garage, Sidcup. 'Phone: 4. [7801

EGERTONS, Northgate, Ipswich, can deliver from stock A.B.C., Skootamotas, and Mobile Pups. [4863

A.B.C. Skootamota, 1920, only 50 miles; £35; as new. —G. G. Williams, Crowland, Peterborough. [X9777

A.B.C. Skootamota, 1920, only ridden 10 miles.—R.M.O., Derbyshire Sanatorium, Walton, Chesterfield. [7168

SCOOTER.—Coventry Stafford, with seat and electric light, not done 70 miles; £26.—170, Red Lane, Coventry. [X0009

1920 Kingsbury Scooter, as new, fitted seat; £28, offers.—Merifield, 15, Balmoral Rd., Kingston-on-Thames. [7139

1920 Autoped Scooter, with dynamo lighting; £25.—Stanleys, 173-4, Railway Approach, Shepherd's Bush, W.12. [8328

A.B.C. Skootamota, brand new, recently from works; £35, carriage paid.—Frank Whitworth, Ltd., 139, New St., Birmingham. [X9947

AUTOPED, brand new, electrically equipped; £21.—Broughton Garage, Gt. Cheetham St. West, Higher Broughton, Manchester. [7605

AUTOPED Scooter, brand new, value 45 gns.; cash or exchange offers; Manchester.—4, Blantyre Av., Walkden, near Manchester. [8202

SKOOTAMOTA, A.B.C., late 1920, practically new, and hardly used, perfect order, fast; accept £30, bargain.—Heather, 83, London Rd., Bromley. [7447

SKOOTAMOTA, practically new, lady owner given up riding, new electric head, tail, and accumulator; £25.—Seen Boyne Works, behind Holland Park Tube. [7656

A.B.C. Skootamotas, brand new; special price, 38 gns.; delivered free anywhere in Great Britain at purchaser's risk.—Egertons, Northgate, Ipswich. 'Phone: 962. [4328

A.B.C. Skootamotas, brand new; 38 gns., list price £55; delivery free anywhere in Great Britain at purchaser's risk.—Howes and Sons, Ltd., Chapel Field, Norwich. [X9874

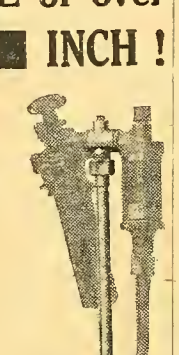
MOBILE Pup Scooters, with seats included, brand new, at special price, £28; delivered free anywhere in Great Britain at owner's risk.—Egertons, Northgate Ipswich. 'Phone: 962. [4329

AUTOPED Scooters.—Immediate delivery 1½h.p. 4-stroke engine, free engine clutch, and dynamo lighting, 1920 model, shop-soiled only; £25.—P. J. Evans, 81-91, John Bright St., Birmingham. [8152

HOODS, WIND SCREENS, ETC.

CAMBER.—Hoods, 50/-; wind screens, 27/6.—Bright and Hayles, 78, Church St., Camberwell. [3794

WIND Screen Easting, £4/10, new, unused; will take any useful accessory in part payment.—64, Bishopsgate, London. [0398



HOOD Materials.—Twill, sticks, celluloid, fittings, etc.; materials complete for re-cover, 14/9.—Henry Jones, 778, High Rd., Tottenham, London. [7408

AUSTER Triplex Adjustable Aero Type Wind Screen, overall size 13×7¾in., 15/- each, including carriage and packing.—George Cumming, 19, Rose St., Aberdeen. [3290

AUSTER Triplex Adjustable Aero Type Wind Screens, 12×6½, brand new, 8/6, post free, splendid value.—S. Lewis, 193, Upper Charlton St., Carburton St., W.1. [7287

AUSTER Triplex Glass Adjustable Aero Type Wind Screens, 12×6½, 10/6 each; electric test lamps, with wire, 2/-.—Bastone's, 228, Pentonville Rd., King's Cross, London, N.1. [2006

THE "BEST" MECHANICAL PUMP will deliver OIL at a PRESSURE of over 100 LBS. per ■ INCH!

Price **25/6**

PLUS COST OF FIXING AT ANY GARAGE.

Manufactured by :—

BEST & LLOYD, LTD., Handsworth, Birmingham.

"The pump has functioned quite correctly ever since fitting. I have run machine in a snowstorm after standing in the cold till the acetylene generators froze, and it made no difference to the oil supply."

T.T. Preparations.

IN less than three months time the Tourist Trophy races will be won and events of the past. Already many firms have their experimental models well in hand, and those who are behind time would be well advised to snatch every available moment for testing purposes. Everything points to very keenly contested races, and since the events are being strongly supported by the manufacturers there is a likelihood of very fast times being made.

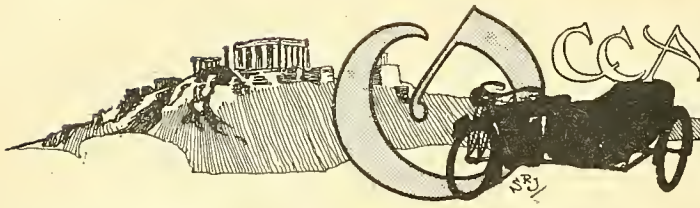
Last year's senior race was fought out between two or three well-known makes, but there were many notable absentees. In 1921, however, most of those firms whose names have figured prominently in pre-war races, and who owe much of their success to the island races, will be competing, whilst there will be newcomers of no mean import.

At least four of our best known manufacturers who have so far been wedded to side-by-side valve gear are giving the overhead type a trial, and it will be interesting to see whether their experiments bear fruit in the Isle of Man.

Two-strokes will figure largely in the junior event and 250 c.c. class, but they are not likely to carry all before them, since some very fast miniature four-strokes are already on the road. It is probable that stamina will be the deciding factor amongst the smaller machines, and it is this very factor which affects the buying public most.

Every year there are a few motor cyclists who voice the opinion that racing effects no direct benefit upon the touring machines, and yet it is hard to name a single prominent firm whose reputation has not been largely founded on racing successes, and whose products have not been improved by lessons learned on track and road events.

Apart from the sporting side of the Isle of Man races their technical value is enormous to any manufacturer who is genuinely on the look out for weak places in his production and their possible cure. Absolute reliability, the ability to maintain high speeds, perfect controllability and braking are essentials over the long and tortuous course, and who can say that these points are not, directly or indirectly, the essentials of a first-class touring mount?



Speed Events.

THERE is every indication that the summer of 1921 will be eventful from the speedman's point of view. More than ever, manufacturers are realising the value—both from a publicity and an educative point of view—of successes in races or record-breaking. The large entries for the spring speed trials augur well for the more important events a little later on, and, no doubt, the thoughtful designer is appreciative of the assistance accruing from such events in producing his machines for the Tourist Trophy and Grand Prix races.

Around midsummer there is a galaxy of important races. In addition to the several meetings at Brooklands, where new racing mounts may be tried out, there will be the T.T., the 500 mile race for the Miller Gold Cup at Brooklands, and the Grand Prix in France, all within a period of five weeks. Probably the 500 mile race would have been more interesting had it been arranged to take place prior to the Isle of Man event, as it would have provided designers with valuable data which even the Tourist Trophy may not produce. 500 miles "all out" on Brooklands is a more severe engine test than the Isle of Man course, and any motor cycle capable of surviving such a trial would prove itself fit to undergo the gruelling of the T.T. On the other hand, it does not necessarily follow that the winner of a T.T. could survive the race for the Gold Cup.

Altogether, a most interesting season's racing is in sight, and the motor cycle movement must benefit by it by reason of the public interest which will be focussed upon such highly sporting events.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY 'IXION'

Do not Forget the Old Crocks.

MR. D. Elyard Brown, of the C.A.V. people, tells me he still has the single-geared 3½ h.p. Ormonde on which he secured a gold medal in the 1904 Edinburgh Run (the first of the historic series), being one of the twenty-two men in a field of forty-six who covered the distance inside twenty-four hours, and thereby confounded the prophets who denied that any 1904 machine could succeed. If I remember aright, he carried no fewer than four twenty ampère-hour eight-volt accumulators, and may probably claim to have been the first motor cyclist to use electric lighting regularly. I remember that in the same year his firm made me a metal box for my rear carrier, containing two Castle accumulators, which provided the ignition current and also illuminated a transparent rear number in the back panel of the case. These reminiscences inspire me to suggest that a number of the old-timers may still possess their ancient crocks, and that it would be rather fun if a special parade—or even a trial—were arranged during the summer for such machines. One of my most treasured possessions is a bound volume of the *Gazette*, which the M.C.C. circulated gratis amongst its members for a few years, commencing in March, 1903.

Did he Know?

THOSE readers who have scanned my disconnected prattle for any length of time will recognise that my nature is a lovable compound of logic and innocence. It let me down badly the other day. I was burbling gently over an atrocious road when I ran into the tail of the most gigantesque dustcloud ever encountered. It choked the narrow lanes from hedge to hedge. The summit of it ascended miles up into the blue empyrean. The vanguard of it disfigured the distant horizon. Says I to myself, says I, "Some oof-merchant on a 30-98 h.p. Vauxhall, full of champagne! I will loaf along leisurely until we emerge upon something like a road north of Exeter, and then I will encourage my A.B.C. to dally with him."

However, the route was long, and the dust titillated my larynx most unpleasantly, so it fell on a time that I strove mightily with the aforesaid oof-merchant, and penetrated into the very heart of his dustcloud. After a suffocating two miles I caught and passed him. The murk was too thick for me to identify his 'bus, but he was merely the very spit of Poy's John Citizen, seated at the helm of a quite tardy sidecar outfit with Mrs. Citizen dutifully beside him. The magnific dustcloud was solely ascribable to the fact that their luggage grid had sagged under two heavy suitcases, and was trailing along the road! I now wish I had paused to enquire whether the task of tucking up the tail of his grid had baffled his resources, or whether a rigid framed sidecar, on an execrable road, jolts so fiendishly that he did not know his luggage was filing down the humps between the potholes?

Kick-starters for Baby Two-strokes.

MY latest baby two-stroke has a kick-starter and free engine clutch. I incur much odium in consequence amongst hard riders. "Muff" and "mammie's darling" are two of the mildest epithets which such a specification provokes from the sort of fellow who rides a single-geared 7-9 h.p. As my excuses have a technical and commercial significance, I make them *coram populo*. There are two-strokes which, on occasion, commence to two-stroke in their garages. There are others—and there are occasions with the rest—when an engine of this type hesitates between two and four-stroking for a matter of a hundred yards or so after it is first started up from cold.

Now if there is a nasty little bit of 1 in 6 right outside your villa gate, and if your usual pillion passenger is a well-nourished person, do you not think it wise and right to ensure that the aforesaid hill shall be climbed under power at the first attempt? If so, the ability "to warm her up in free" is a *sine qua non*.

One might add that the fair sex are nowadays very interested in baby two-strokes, and that few of them love the jump mount. Wherefore any two-stroke maker on the lookout for the largest nett sales should list a kick-starter if only as an option.

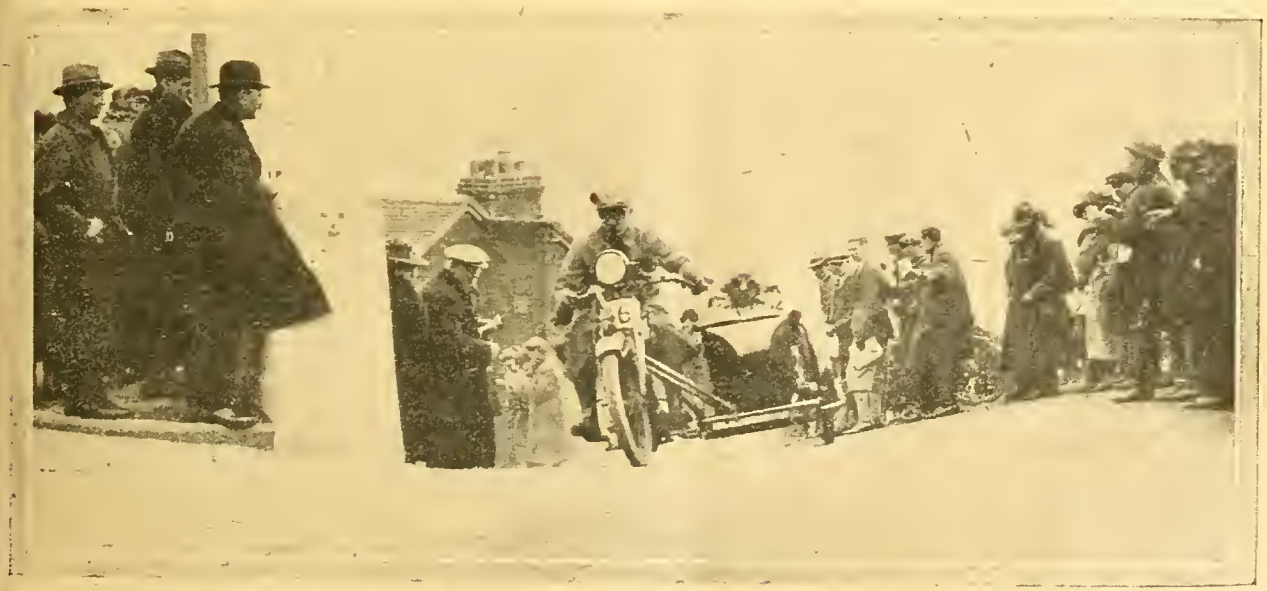
Over-organised?

ON tour the other day, I ran over a pound of nails which some unscrupulous garage owner had presumably deposited in the roadway, until my back tyre resembled a hedgehog (spasm 1), and then a sieve (spasm 2). I used all my patches and solution, and finally struggled into a town, where I stopped at the kind of garage which reminds one of an R.E. base depot, so highly organised that the men can't chalk your cover without filling in a store ticket. Here I bought and fitted a new inner tube, arranging for the old one to be posted on to my destination for the night. Later in the day I ran over another pound of nails, and next morning I was eagerly awaiting the postman. He staggered up to the door stooping under a large parcel, which proved to contain six large char-à-banc size inner tubes. Next time I strike trouble I shall patronise the kind of garage which consists of an army hut dumped near a blind corner, when an ex-corporal of signals sits hungrily waiting for a collision in order that he may send his wife to the village store for a pound of margarine. I prefer personal attention to over-organisation. But I should like to have heard what the char-à-banc owner said when he received my 26 × 2½in. tube; my own verbosity was censored by the presence of my hostess on the doorstep.

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Making Smiles Grow.

I AM just home from watching some cracks—and others—contest a big trial. There is a lot of human nature to be trapped by the observant in such events. I collected several lumps at the freak hills. For example, I stationed myself at a hairpin of the double or meathook type, where the surface was of deep, wet loam, garnished with assorted boulders. What golfers call the "approach" consisted of a water-splash, beneath which lurked immemorial mud of unknown depth, whilst the double bend was excellently camouflaged by an innocent-looking shrub on the right. The first man up was a broth of a boy, who greeted the spectators massed on the footbridge with a friendly grin, opened his throttle, charged the splash like a champion hurdler, and evidently intended to impress his audience. He cast up a bow wave of extraordinary dimensions, accomplished a miraculous slither in the hidden mud, commenced the ascent with his near-side footrest leading, and finally scrabbled up the hill with much cavorting and foot-slogging, looking a sadder and a wiser man. No. 2 had more sense. As soon as he saw the water-splash, he went down into bottom gear, slowed down to a crawl, and ambled through very cautiously and not uncreditably. As he sighted the boulders sticking out of the loam like almonds in a cake, he pursed his lips, tightened his wrists, and commenced to ride very, very carefully. But his front wheel presently hit a big stone, and he disappeared muttering impious ejaculations. Nos. 3 and 4 were pals, who loved each other so dearly that it was their habit to ride with their handle grips all but touching from start to finish. Incredible to relate, they attempted to negotiate the aforesaid packet of trouble like Siamese twins. All went well till Joe found himself forced on to the more bouldery portion of the hairpin, whilst Jim was riding easily on a smooth, if greasy, rabbit track about four inches wide, and, moreover, had the wide side of the wickeder half of the meathook. Joe screamed lurid objurgations at Jim, who knew when he was well off, and neither accelerated nor cleared the delectable bit of the track. With an oath Joe plunged at the stony road centre, skidded, twisted, and rammed Jim's machine heavily in the region of the carburetter, unseating both men. I will not stain our meek pages by repeating what they said to each other. An age-long friendship was apparently shattered beyond repair. Presently there appeared a veteran trials rider: in other words, a small, cautious figure, with a cynical countenance, twinkling with the tired humour you may find in a very old man. He was well out by himself, having no fancy for close company when a wicked secretary is devising pitfalls for the unwary. He came along at a crawl, and attempted no stunts. Bottom gear in plenty of time, of course. Throttle right back. Legs, wrists, back, and thighs braced into trussed girders. Keen eyes performing prodigies of path-picking. He made no more bones of this find-a-winner corner than a novice makes of the Portsmouth Road on a summer afternoon. His front wheel never swerved, and his feet never wavered from the rests.



Where are the Scooters?

AGAIN I ask, where are the scooters? I don't mean the *fin de siècle* type with a 2¾ h.p. engine and two speeds, but the old originals, which were mass-produced (or so the advertisements said) with one cylinder about the size of the pots in which the revue girl buys her lipsalve. So far I have traced three, viz.:

No. 1.—Bought by a young artist during the boom. It wouldn't climb his drive, so he sold it *at a profit* to a sportsman who wanted to own the first scooter in Seaville, and finally dropped it off the pier at midnight in a huff.

Nos. 2 and 3.—Bought by a married couple, who live near the foot of Sutton Bank, and dislike walking. These are now rusting in a marine store. I think they were bartered for a job of grinding scissors.

Anyhow, *The Motor Cycle's* withers were unwrung, for we never believed in the little beasties, and frankly said so. Meanwhile, the lightweight is making good.

J. E. Greenwood, designer of the Sunbeam, piloting his 3½ h.p. sidecar over the crest of the Old Wyche in the Victory Cup Trial.

Single and Twin-cylinder Models with Three-speed Gears and All-chain Drive.

AFTER a long adherence to belt drive, the chain-driven Rudge machines are at last a fact.

A preliminary model was exhibited at last year's Olympia Show, but since then certain modifications, notably in the clutch design, have been carried out, and both single and twin-cylinder machines will shortly be available.

A few days ago a road test of the two models was undertaken, and we were particularly interested in the running of the single-cylinder machine, for of late it has not been so prominent in the competition world as of old on account of the narrow gear ratios, which placed the belt drive models at a disadvantage in modern freak-hill trials. The new three-speed chain-drive will no doubt bring the excellent 3½ h.p. single Rudge engine once more into the forefront of trials winners—a position which it justly merits.

SPECIFICATION.

ENGINES: Rudge single, 85 × 88 mm. (499 c.c.); twin 85 × 88 mm. (998 c.c.), overhead inlet valves.

GEAR BOX: Rudge three-speed, constant mesh.

CLUTCH: Ferodo and steel plates on engine-shaft, hand controlled.

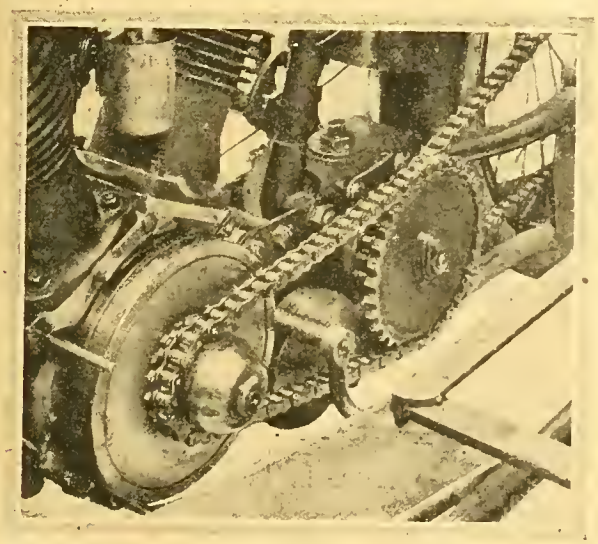
TRANSMISSION: ⅝ × ⅜in. chains, front enclosed

WHEELS: 650 × 65 mm., interchangeable.

LUBRICATION: Heel-operated oil pump

Briefly, the machine closely resembles former Rudge models, for the engine, forks, and frame are of the same type as those used on the I.O.M. multi machines. The rear portion of the frame (*i.e.*, chain stays, back stays, etc.), is detachable, and has a special bracket to carry the new Rudge three-speed gear box. Instead of hanging the box from the bracket by means of vertical studs, the bracket itself is of channel section, and the walls of the channel have longitudinal slots through which pass two horizontal bolts in the top of the gear box casting. An eccentric on the top of the bracket meshes with a suitable recess in the upper surface of the box, so that its rotation slides the box to or from the engine as required for purposes of chain adjustment.

Gear control is obtained by means of a long lever mounted on the top of the gear box; the mounting embodies a quadrant with a spring plunger device on the lever for locating the latter in the required positions, while a gate is fitted beside the tank to facilitate gear changing.

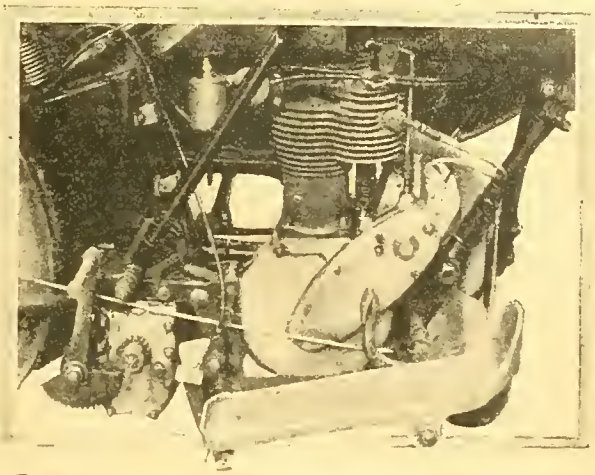


Chains of ⅝in. pitch × ⅜in. width are used throughout, and the clutch, which is located on the engine-shaft, has four large diameter plates, two of steel and two with Ferodo inserts; the clutch is controlled from the handle-bar, and is sensitive in operation. Covering the clutch, the front chain, and the countershaft sprocket is a large aluminium cover, which, like the crank case, is a smooth casting with no excrescences, the whole being easily cleaned.

The above remarks apply almost equally to the 7-9 h.p. twin-cylinder model. Both machines are

Road Tests of New Models.—

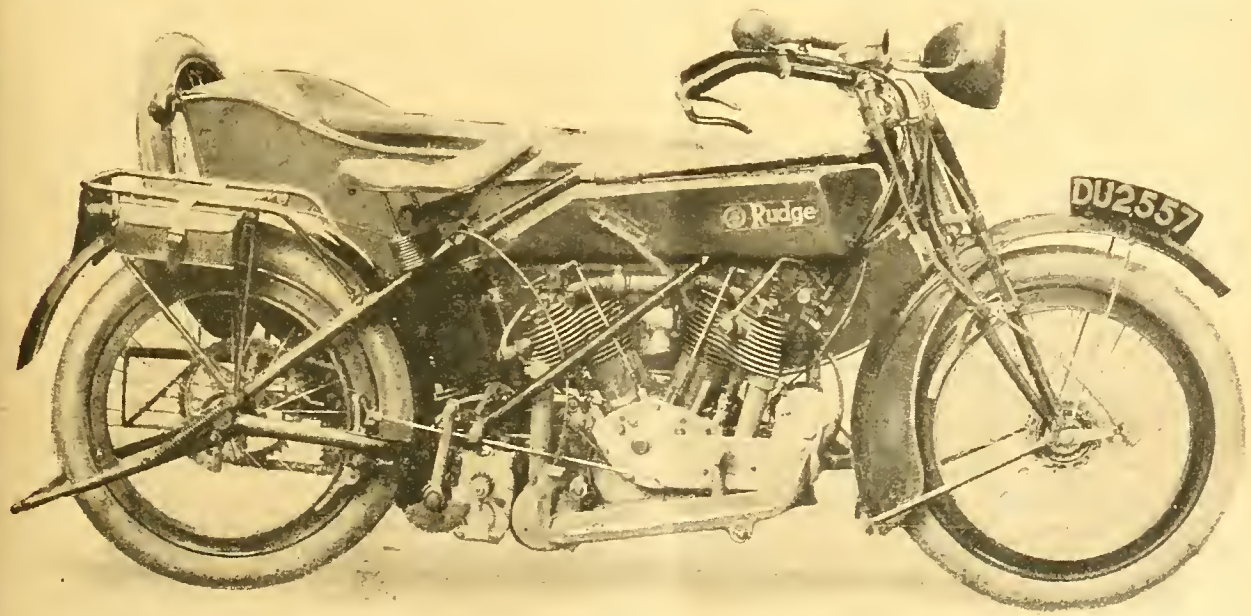
equipped with the same transmission, and only minor differences, such as the use of Lucas Magdyno on the twin and an M-L Maglita on the single, were noticed; the single also was burdened with an unduly heavy sidecar.



Actually under way, it was found that the engine was capable of a fair turn of speed, but, owing to a high top gear (4½ to 1), the 1 in 9 gradient was just too much without changing down to second.

In place of the more conventional location on the countershaft, the fabric and metal plate clutch is mounted on the engine-shaft.

In view of the fact that the engine is of 499 c.c. capacity only, the performance generally was good, and we must admit that all through, our impression was that the machine was of the new more common 500-600 c.c. class.

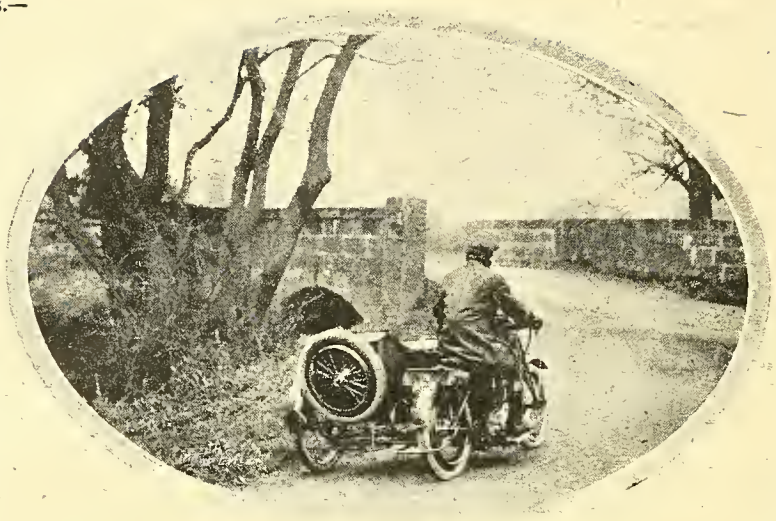


In general, the machine, regarded as an outfit, is comfortable and easy to handle, the low riding position, combined with moderately wide handle-bars and large footboards, allowing an easy attitude. The

Engine and gear units of the single-cylinder model. Observe the kick-starter and the heel pedal for the oil pump.

only foot controls are both situated on the right footboard, the near brake pedal being at the front, while behind, and convenient to the heel, is the oil pump pedal, the oil tank being carried on the saddle tube as in usual Rudge practice.

Changing over from the single to the twin, we found a remarkable difference in speed and power, as was only to be expected with an engine of twice the capacity. With a high top gear the big engine trickles along at 20 m.p.h. in the easiest way imaginable, while its all-out speed with a sidecar is rather exhilarating, to say the least; rushing over half a mile of 1 in 9, the speed never dropped below 37 m.p.h., even at the summit, and would have been still higher



The three-speed chain-driven 7-9 h.p. twin Rudge with interchangeable wheels. A 3½ h.p. single-cylinder model with similar specification is also being made.

Road Tests of New Models.—

if the whole outfit had not bounced on the rough surface and so lost speed.

With a really fast machine powerful and smooth-acting brakes are a *sine qua non*, and the flat Ferodo-faced slipper type used on both front and rear wheels of the Rudge are excellent, especially in their smoothness of operation. Two points only call for criticism—the first is that the twin-cylinder engine is by no means silent in operation; while the second, applicable to both models, is the lack of guarding for the rear chain. In all other respects, however, the machines will most certainly take a front rank, and we look forward to their successful participation in the 1921 trials.

Although our test was primarily connected with the machine, a word of praise for the springing of the Rudge sidecar must not be omitted

Detachable and interchangeable wheels are used on the chain-driven Rudge models.

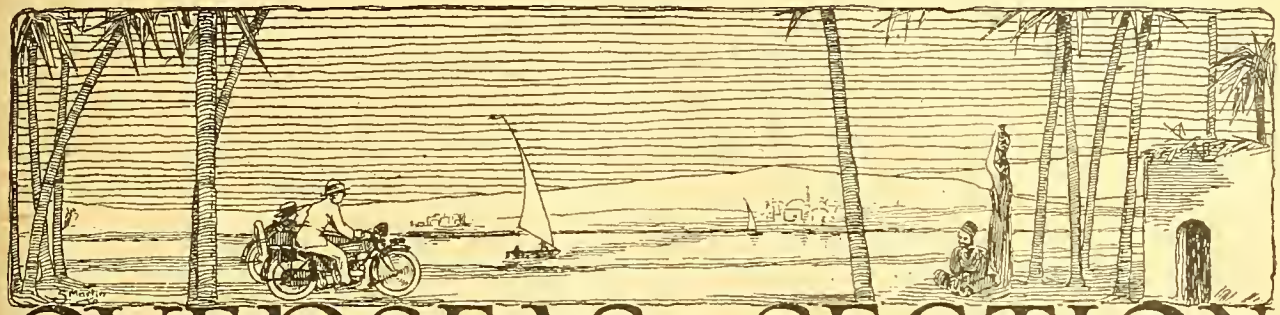
FUEL ECONOMY—IS YOUR GEAR TOO HIGH?

THE considerable increase in petrol consumption due to raising the gear ratio of a motor cycle is only appreciated by those who have experimented in this direction. A well-known carburetter manufacturer recently gave us several examples of a falling off of good consumption figures through raising the gear. One firm of motor cycle makers, he informed us, had obtained very good results one year, but with the same engine and machine there was a considerable falling off the next. It was found that the gear ratio had been raised, and as soon as the original ratio was reverted to the former low consumption was obtained.

In another case it was found that 28in. instead of 26in. wheels were being used, without alteration to the gear ratio to counteract the effect of the larger wheels. [This effect, by the way, is greater than might appear at a glance: actually it means a 7½% higher "gear."]

We recall a test made by a prominent firm with two "big twin" outfits regarding the gear ratio of which two of the technical staff could not agree. Identical in every respect, excepting gear ratio, with the same load, the two machines were sent over a 100 mile course side-by-side. The machine with a 5 to 1 top gear was infinitely better than its companion on 4 to 1.

MUDGUARDING AND LARGE TYRES.



IT seems to me that the enthusiastic advocates of large wheels and tyres purposely ignore one important point—the mud and dust proposition. The gentry who ride huge twins solo, and who, perhaps, are particularly to the fore in stating their views—personally, I have just finished riding solo the hugest twin purchasable—do not, as a rule, care though they get as muddy as the bed of the Mississippi, or, rather, they are prepared to accept as much mud as happens to be thrown at them in return for the unquestionable advantages of the breed.

Now, in all conscience, the ordinary run of British motor cycle, equipped with 26 × 2½in. tyres, is muddy enough for most people, but I never realised what difficulties are in the way of the mudguard specialist till I owned my present sidecar outfit—a heavy affair of 10 h.p., equipped with 28 × 3in. tyres. These tyres make an immense trough on the road surface, and the outfit, accelerating up to 48 m.p.h. without effort, fills the vacuum in its wake with minute particles of road surface, be it dust, mud, or water. This rearguard of minute particles attaches itself to the rear of the rider and his passenger, and nothing will keep it out. Leg shields are essential, for without them the rider on a wet day becomes literally saturated with liquid mud up to the shoulders—no exaggeration. The shields, however, increase the area of the vacuum in the rear, and though they defend one from frontal attack, they tend to supplement the force of the rear assault.

I am aware that a great many sidecar outfits are not such mud-slingers as my present mount, but my experience is that a fast machine having big tyres is about the filthiest type of mount one can have.

I put the blame of the mud slinging capabilities of my present machine entirely on the huge tyres, as the mudguarding has been considerably improved. The size of the wheels does not matter, but if we increase the width of the road tread we at once increase the greatest drawback to the existing type of sidecar outfit—mud! The force at which mud is ejected from under the tread must increase enormously with every millimetre of width of tread, and, whereas a 2in. tyre throws out a comparatively limpid splash, a 2½in. tyre hurls out a high pressure fountain, while a 3in. tyre blasts forth a mud stream equivalent to shot from a blunderbuss.

CHINOOK.

OVERSEAS SECTION

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Oversize Tyres. YEAR by year larger, or "oversize," tyres are coming slowly into their own on British machines. In section and in diameter, present-day standards have increased greatly on what was ample in pre-war times. This is all very much to the good, for the higher average speeds attained by more efficient engines are made possible without a corresponding increase in road discomfort. Indeed, it is considered by some that the super-diameter tyre of the distant future may prove a simple and efficient solution of the rear springing problem. But the point we wish to emphasise here is that, big and "fat" as are the tyres on 1921 mounts, there are many cases where they might be even larger yet. Hard riders in the Home Country recognise this, and either specify or themselves fit "oversize" tyres (in its literal sense). For example, on 26 × 2¼in. standard rims it is becoming quite popular to fit 28 × 3in. tyres, which in conjunction with security bolts have been found entirely satisfactory. For the other common size of British rim, 26 × 2½in., there are, of course, specially made 26 × 3 × 2½in. covers, with which, however, security bolts are unnecessary. Readers carrying out either of these conversions should remember that they both automatically raise the "gear" of the machine, although the actual engine-sprocket to wheel revolution ratio remains unaltered.

❁ ❁ ❁

Australia and International Records. SPEED events, on road and track, are immensely popular in Australia, and this development combined with a preponderance of solo big twins has resulted in some very fast times being recorded there over various measured distances. Electrical timing at these events is the rule rather than the exception and, quite justifiably, our Australian friends wish to know if their records are eligible for consideration as *world's records*. For the benefit of several correspondents we may, briefly, make the present position clear.

In addition to approval of the record by the Federation of International Motor Cyclists it is necessary that the attempt be measured and timed by a representative of that body or of an approved affiliated club. The F.I.C.M. has laid down exhaustive regulations governing attempts on international times, including, of course, the two-way "mean speed" stipulation regarding all short distance times, but there are no limitations regarding locality such as imagined by one of our overseas readers, who recently asked if, "to create a world's record, the ride must be made at Brooklands? No; to have a motor cycle record considered for international honours, be it made on a beach in South Australia or a dirt-track in Canada, it is only necessary to comply with the requirements, and to obtain the approval of the F.I.C.M.

Mr. T. W. Loughborough, 83, Pall Mall, London, W.1. is the general secretary of the Federation.

❁ ❁ ❁

In the Wilds! So many of our readers send us terrifying reports of "roads" that are not roads, of hills that are unclimbable, and of various other conditions that do not make for pleasurable riding in the out-of-the-way corners of the world, that one might well pause and consider if the game is worth the candle in such circumstances. Even without allowing for a certain amount of, possibly unintentional, exaggeration (for these selfsame Jeremiahs generally acknowledge that they still own and use motor cycles!), there is a brighter side to the use of a motor cycle in the wilds. To the legislation-smitten and taxation-harried rider in more "civilised" realms, the lot of the pioneer country motor cyclist is indeed a happy one. There being few or no motor laws, the police, if any, have no terrors for him; natural conditions only limit his speed, and the design of his engine the noise he may make. He knows not the worry of nursing a rear light through an anti-motoring district; if the almanac permits he may even dispense with his head lamp and cruise along in the silvery moonlight. Increased taxation and licence holders do not interest him; in some cases he may be able to allot himself registration numbers, or else dispense with them altogether. Finally, however atrocious his roads, there are no tramways!

A Selection of Letters from Readers scattered all over the World.

British, American, and German Motors in Ceylon.

MR. G. W. MOTLEY echoes briefly the general sentiment of the majority of our overseas readers. The German circular to which he refers is an "Invitation to the Leipzig Fair," printed mainly in English. He writes:

"British manufacturers might be interested to know that I have received the enclosed German circular, which, although it does not deal with the motor cycle trade, shows that Germany is again trying to get trade back.

"A German Adler car has already been imported into the island.

"I and many others would like to see British cycles and cars replace the hundreds of Americans which are on the road here."

Overseas Section.—

Show Criticism from New Zealand.

From Wellington, New Zealand, comes the following criticism of cycle cars at the last Show. "BANISHED," as our correspondent signs himself, to be in the fashion also appends an ideal specification:

"Possibly a few notes from this distant corner of the motor cycling world may be of interest to your readers. Naturally, one sees very little of recent developments here, and one relies entirely on your entertaining paper for being kept up to date.

"The long-looked-for Show numbers have just arrived, and I cannot help being struck by the over-development of the illogical sidecar outfit and also the odd mentality of those who design three-wheeled runabouts. They seem quite incapable of grasping these apparent facts:

"1. A 550 to 750 c.c air-cooled engine has been *proved* to be capable of taking two people over any ordinary roads with comfort and economy.

"2. The driver would like his seat arranged so that he may share the passenger's comfort.

"Surely it is possible to embody the good points of a sidecar outfit in a three-wheeled chassis, borrowing a few odd fitments from car practice. It seems necessary, however, to resort to *(a)* bigger engines, *(b)* water cooling, and *(c)* excessive weight. One or more of these points seem to apply to the three-wheelers at the Show.

"One is tempted to ask whether the Scott Sociable offers a better fuel consumption than the G.N., which certainly beats it on price, appearance, and speed? By the way, how does one *clean* the chassis?

"I will not comment on the five-wheeler on show, except to suggest that having bought five wheels one might with advantage ride on four of them. For the rest, designers seem to have solved their difficulties by taking a four-wheeler, lopping off one wheel, and making a small—a very small—price allowance on account of it.

"Price would appear to be a comparatively small point, however, to most riders *if* the right sort of value is offered. This value, I suggest, should be lightness, high efficiency, and slow depreciation. An extra £50 on the purchase price costs in interest only, say, £4 per annum. Slow depreciation and an engine which runs on a whiff of petrol are cheap at any price. It is the *annual* cost which matters.

"Not being an engineer, I put forward the following suggested specification with all diffidence:

"1. Air-cooled engine to taste, lively and economical, say, 6 h.p. flat twin.

"2. Four-speed gear or three-speed and reverse to taste, integral with power unit.

"3. Morgan chassis.

"4. F.N. drive.

"5. Cotay disc wheels, made interchangeable on the Sunbeam plan.

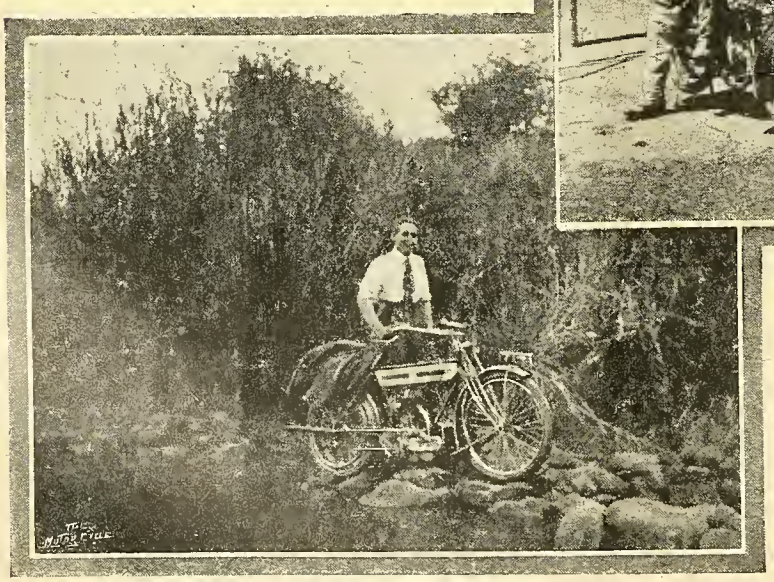
"6. Electric light. Option of dynamo.

"7. Comfortable, but not luxurious body. Plenty of luggage space. Spare wheel.

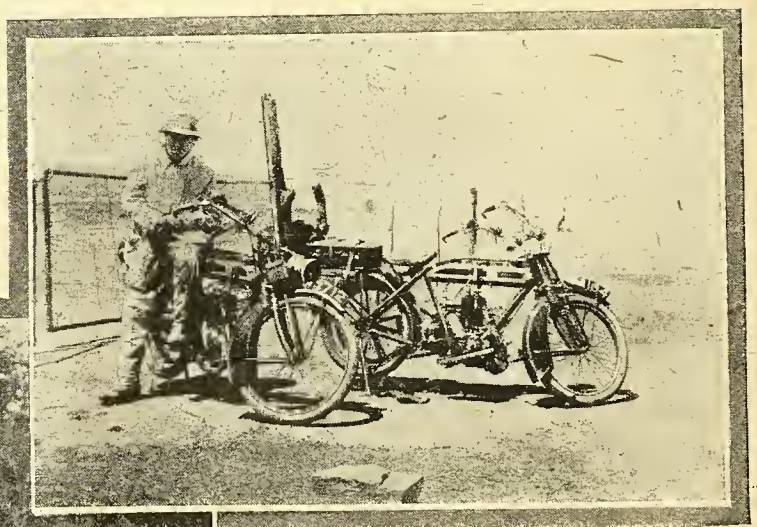
"8. Cost £200 to £250, but not to be built to a price."

In Cyprus.

"Where roads are a luxury," is how "CITIUM" describes Cyprus. His views on the ideal overseas machine have therefore been formulated accordingly:



"I am a Colonial and wish to express (if I may) my views on motor cycles in a country where roads are a luxury.

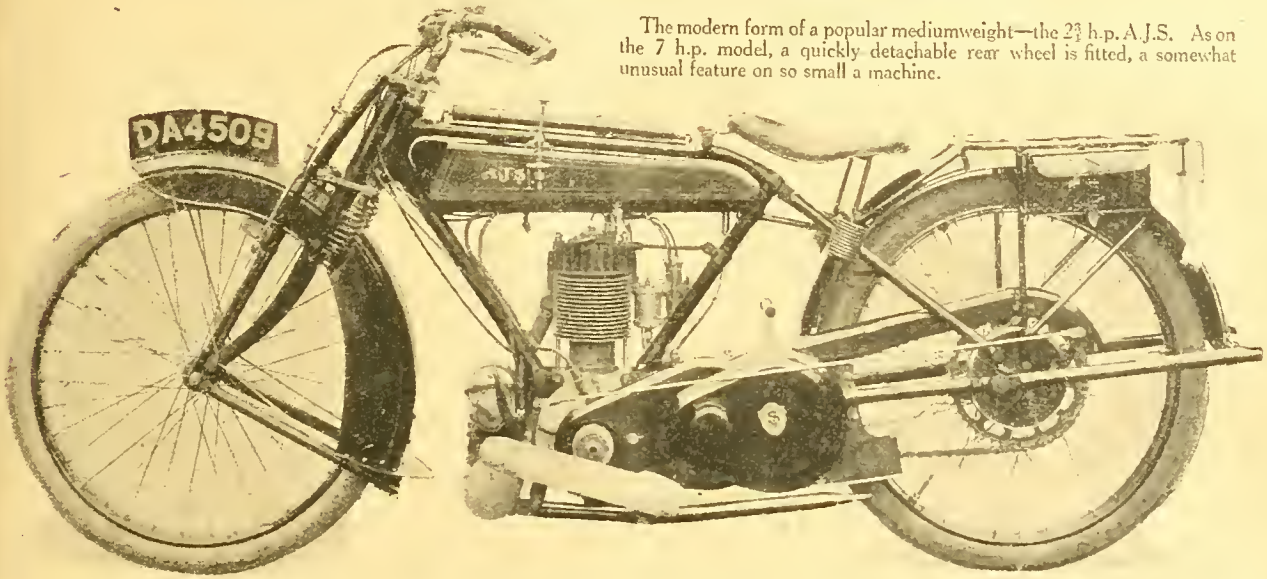


"First and foremost, I consider a heavy machine much more suitable for this sort of work than a lightweight. With a lightweight you may run along O.K. till you come to a really rough road. After you have done a couple of miles of this you wish your machine was made of solid lead. Of course when I say a rough road I mean a rough road. It wouldn't be called a road at all in England, but we have to because the map says it is so.

"So I choose a heavyweight. Now my machine, although being a heavyweight, must be very well sprung. When building a machine for Colonial use, manufacturers should consider springing a prime factor.

"After bad roads, the next monster we have to contend with is mud. One often comes across a long stretch of road which is covered with a sort of silica clay, lovely in the summer but a terror in the winter. Apart from slipping and sliding all over the place, the mudguards are bound to get choked up within the first hundred yards. I have now fixed my front mudguard in such a way that I can easily take it off at the first signs of this clay. Of course I get a lump of mud, the size of a cottage loaf, deposited on and around my magneto, but that's taken off with greater ease than when jammed between tyre and mudguard. The chief collecting centre seems to be the front fork. There is never enough clearance between tyre and fork, which, I think, should have, at least, 1½in. on each side.

"The next point is, of course, plenty of ground clearance. A machine with its engine too low will soon 'go west.'"

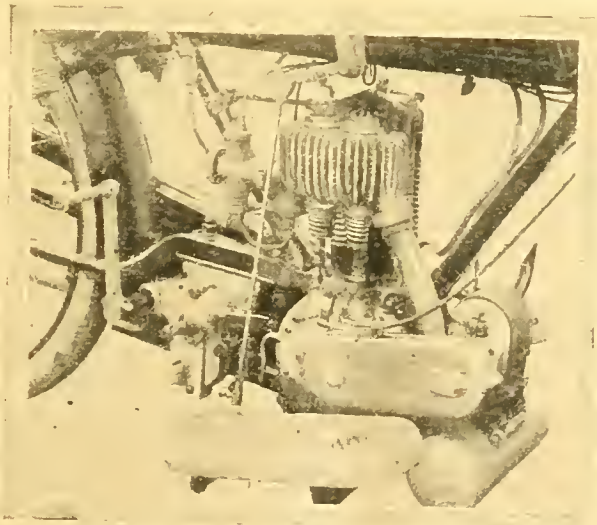


Although thousands of motor cycles are being exported, old type machines are still serving riders overseas. Here are Premiers and an old Triumph which are still doing good work on the Veldt—a country, too, where garages are few and far between.

A Medium-powered Three-speed Solo Mount.

The 2¾ h.p. A.J.S. Reintroduced with Many Refinements.

The modern form of a popular mediumweight—the 2¾ h.p. A.J.S. As on the 7 h.p. model, a quickly detachable rear wheel is fitted, a somewhat unusual feature on so small a machine.



THOUGH mainly associated with sidecar machines, the magic letters A.J.S. have figured largely in all speed events since last spring. The overhead valve 2¾ h.p. type which won the 1920 Junior T.T. has earned a wonderful reputation for speed, and was the first motor cycle of under 350 c.c. to accomplish a speed of 80 m.p.h.

Many of our readers also will remember the highly successful pre-war 2¾ h.p. A.J.S., and it is this machine, incorporating all the refinements acquired by experience in other fields, which is now being introduced to the public.

Roller Bearings.

The engine, a single-cylinder of 74×81 (349 c.c.), is a typical A.J.S. production, and closely resembles half a 7 h.p. engine. A detachable head is, of course, retained, and the clamping bar is fixed to a "steady" bolted to the saddle tube. Roller bearings are used throughout the crankshaft; and the back of the magneto chain case is cast with the timing gear cover plate.

Chain drive is employed throughout, a three-speed gear box with dry plate clutch and powerful kick-starter being neatly housed in the bottom bracket. Incidentally, this gear box is provided with a screw adjustment for chain tension of sensible proportions. A simple coil spring shock absorber is fitted on the engine shaft.

The cylinder dimensions of the new A.J.S. lightweight engine are 74×81 mm. (349 c.c.). Note the "steady" to the cylinder head.

The frame is a neat and very sturdy piece of work, the top tube being slightly sloped and dropped at the rear end. Contrary to the practice employed on the 7 h.p. model, the tank is not of the saddle type. Druid forks and a saddle pivoted to the top tube and supported from the carrier are used. The finish is excellent.

Weather Protection.

Both front and rear mudguards are sensibly proportioned, and the former is widely splayed behind the forks so as to provide ample protection. The front chain is almost completely enclosed, and the rear chain is protected over the top run, while the lower run is shielded from any mud which might drop from the tyre.

Footboards covered with thick rubber pads and a silencer which is both large and efficient complete a very workmanlike specification, and we feel sure that the 2¾ h.p. A.J.S. in its latest form will fill the very large demand for a well-made "go anywhere" medium-powered machine.

A short run round convinced us that its capabilities do not fall short of its appearance, but we will defer further comment till we have thoroughly tried out the new model on the road.

ROAD CONDITIONS.

THE A.A. has issued a series of maps showing roads particularly to be avoided, and, in some cases, alternative routes. It is emphasised that these maps do not show every road in poor condition.

Under the classification of "Roads to be Avoided" are the following:

NORTH-WESTERN COUNTIES.—Kendal to Shap (first eight miles), Kendal to Kirkby Lonsdale,—Doncaster to Boroughbridge, Pocklington to Beverley, Doncaster to Barnsley.

NORTH-EASTERN COUNTIES.—Newcastle to Brampton, Newcastle to Otterburn.

MIDLAND COUNTIES.—Northwich to Holmes Chapel, Northwich to Warrington, Birmingham to Wolverhampton, Coventry to Nuneaton.

EASTERN COUNTIES.—Downham Market to Ely, Downham Market to King's Lynn, Norwich to Bungay.

WESTERN COUNTIES.—Bath to Radstock, Bath to Chippenham (first six miles), Yeovil to Shaftesbury, Shaftesbury to Wilton, Barnstaple to Ilfracombe.

HOME COUNTIES.—Chelmsford to Burnham, Colchester to Mersea, Hastings to Eastbourne.

In Scotland, Argyllshire, Caithness and Sutherland possess a majority of bad roads; while around Stirling, also, practically every route is out of condition.

CAR PRACTICE OR SIMPLICITY.

Will the Future Motor Cycle be fitted with a Body? Idealism and Practicability again Discussed.

AS to whether the motor cycle of the future will reveal that its designers have followed car practice in order to improve them is a question only time can answer. At the moment, however, much interest is focussed on this point as a result of the controversy which has appeared in these pages, and which was opened by a critic's survey of the motor cycles at the last Olympia Show.

It will be recalled that this writer suggested that present-day motor cycles could be improved by the embodiment of car features. Recognising the dangers of over development we qualified his plea, because price is a question of paramount importance with a motor cycle, therefore simplicity should be a more useful objective than elaboration.

CAR DESIGN AND THE MOTOR CYCLE.

That eminently representative, and always interesting, journal *The Motor Cycle*, to which, let me say, the movement owes a tremendous debt of gratitude, did me the honour of dealing at considerable length with a contribution (under the above heading) to *The Times* a week or two ago. That this journal and myself are at variance upon certain relatively trifling details was only to be expected, but upon the main points at issue I believe we see eye to eye.

At all events, the article in question is one with the spirit of which I am in entire agreement, though it contains certain contentious material which, I think, would be all the better for being thrashed out. Thus, for instance, when I was so bold as to enter the controversy, I wrote: ". . . as a vehicle for the transport of passengers, it (the motor cycle) is so obviously less highly developed than a car. The mere fact that the motor cycle demands special clothing is a case in point."

In reply to this, *The Motor Cycle* said: "We do not agree that this is a case in point. To render a motor cyclist immune from the inconveniences of mud does not necessarily mean following car practice. In the majority of cases, the special clothing mentioned is necessary to protect the rider from the wind and cold rather than the mud. . . . This vital point (making motor cycles weatherproof) is hardly relevant to the question as to whether motor cycles should follow car practice."

Weather Protection Essential.

Now, with submission, I maintain that it is very relevant indeed, and I propose to base my argument upon two facts. In the first place, when motor cars were at a very early stage of their development, they were, so far as wind and weather were concerned, in much the same case as the motor cycle of to-day. Some of my earlier experiences were gained in cars that boasted neither body sides, nor hoods, nor screens—and bitterly uncomfortable they were. For all practical purposes a squab seat, when utterly exposed to the elements, is neither more nor less luxurious than a saddle.

Car manufacturers were not slow to see that if their products were to have an extended vogue, something better had got to be done, and it will be remembered that, once this realisation had been made, the evolution of windscreens and high-flanked bodies was amazingly rapid, and that, incidentally, the popular demand for cars (*i.e.*, from buyers who were not technicians in the least) grew in proportion.

I hold that the type of sidecar which is now deservedly popular materialises the direct influence of car design. Long after car bodies had become commonly equipped with high side doors, and hoods, and screens, the typical sidecar remained a thing of basket work, with no better protection for its passenger than a thin apron of American cloth. To-day it is modelled deliberately upon the latest thing in torpedo touring bodies.

While the car has many qualities which the motor cycle designer should set as standards to attain, motor cyclists are inclined to the opinion that it does not follow that car design must be copied.

The Times correspondent on motoring matters entered the controversy with a long contribution to that newspaper criticising the motor cyclists' view, and in a recent issue we reviewed these comments.

We confined our remarks to the question of following car practice, and the term apparently has been more widely interpreted by *The Times* correspondent, who now replies with the following contribution, from which it will be seen that means for weather-proofing are regarded as car practice, whereas the original critic confined himself to the mechanical elements.

By the Writer of "The Times" Article.

Surely this cannot be an accident! Just as the old-time motorist demanded something more convenient than leather clothing to protect himself from "wind and cold," so I am confident will the motor cyclist of the future; and it seems clear to me that in that case car practice *must* be followed in the solution of the problem.

Another point upon which *The Motor Cycle* took me to task was my statement that "the two-wheeler is more often found in trouble by the side of the road than is the ordinary car." My critic said that the inference as to the unreliability of the motor cycle was erroneous, and went on: "Actual breakdowns are really few and far between, and roadside adjustments come under several headings. First, the motor cyclist is prone to 'tinker'—it is part of the game."

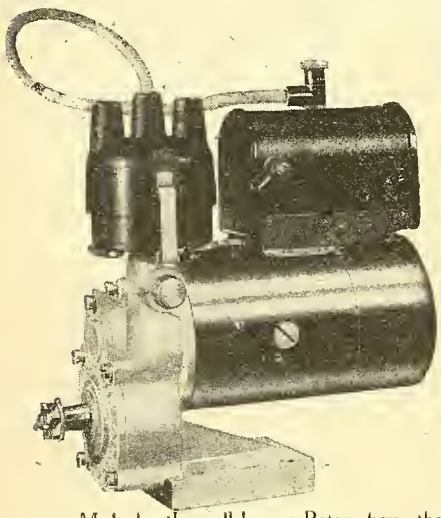
Appealing to the Non-mechanical.

It is unnecessary for me to quote further, for this sentence lays bare the whole root of the matter. One of the reasons I advocated a closer study of car principles of design on the part of the motor cycle producer is because he is too ready to see in the "tinkerer" the whole of his *clientèle*. Tens of thousands of potential motor cyclists are frightened away by the mere idea of "tinkering." To them it is not "part of the game" at all, more than that they regard the motor cycle, not as a pastime in the least, but a possibly valuable form of mechanical transport giving train-like service at command.

To reach this class of buyer, designers must exercise their psychological faculties. They must hide the forbidding complications which it is undesirable should be seen. *The Motor Cycle* knows as well as I do that, in beginning to go in for "simple externals," many makers are already following fundamentally "car" practice. It will also recollect that at one time the mechanical economy of the four-wheeler was also exposed to view. Does it seriously suggest that the car would be what it is to-day if this ingenuousness had been persisted in? When *The Motor Cycle* said, "Because certain features are embodied in a car is no criterion that they will improve the motor cycle," I agree heartily with it, for I have never advanced any such preposterous argument. On the other hand, it will, I am sure, concede that gear boxes and leaf spring suspensions are entitled to be called "improvements," even although they may cost money. What I have all along represented is merely that car ideals should be regarded more attentively by those whose responsibility it is to develop the motor cycle. One of the most useful of those ideals is the production of something which will appeal as much to the non-technical mind as to that of the engineer, and I uphold the basic ideas of car design for the motor cycle on the ground that the "ignorant but interested" outnumber the "enthusiastic and instructed" by twenty to one at the very least. The former should be catered for far more than they are at present.

TRIALS ARE POPULAR!

The support accorded the 1921 trials augurs well for this year's large programme. Scenes such as these will be witnessed every week-end for many months to come.



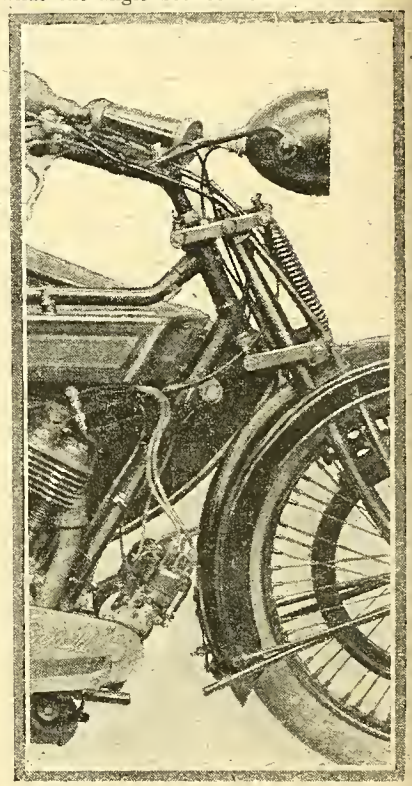
Scenes on well-known trials routes in the Midlands.

Dynamo-battery Lighting and Ignition.

A Description of the Rotax Igdyno Set, which eliminates the High-tension Magneto.

WHEN the magneto came into general use about the year 1907 it seemed that the battery system was killed for good and all; and so it was in its original form. Of late, however, especially in the car world, the battery system of ignition has received a new lease of life. The new method of application is very different from the old accumulator arrangement, as the current is all the time passing from the dynamo through the accumulator and keeping it up to its

Made by the well-known Rotax firm, the Igdyno lighting and ignition unit (twin-cylinder model).



work. Moreover, wiring and terminals have been improved, to say nothing of improvements in the battery. Certain American motor cycles are also fitted with accumulator ignition in conjunction with dynamo lighting sets.

The Rotax Igdyno (made by the Rotax Motor Accessories Co., Ltd., Rotax Works, Willesden Junction, London, N.W.10) is the first British outfit of this nature to appear on the market. It consists of a dynamo, high-tension coil, and a distributer incorporating a low-tension contact breaker. The particular pattern under review will bolt on to a magneto platform, and can be driven by the same method as the magneto. The dynamo is geared up from the driving shaft so as to rotate at its correct speed, while the distributer is geared down again by means of skew gearing. The remainder of the outfit consists of a six volt accumulator, a switchbox including fuse, a head lamp, side lamp, tail lamp, and ignition switch.

Advantages.

Current is supplied to the battery all the time the machine is running when the switch is placed in the charging position, and when the lamps are alight. From the battery also current is taken to the stationary high-tension coil mounted on the top of the dynamo, passing through a contact breaker on the way. High-tension current from the coil is then directed to a distributer in the case of multi-cylinder engines, and so to the sparking plugs.

Special advantages of this system are that the characteristic weakness of the magneto spark on full retard is eliminated, for the maximum spark is given at any position of the contact breaker; this permits of the engine to be started easily on retarded ignition, and also gives very slow running. As the intensity of the spark does not depend upon the "maximum" position of a magneto armature, there is an equal spark at both cylinders of a V twin engine, no matter what the angle between them.

The Rotax Igdyno lighting and ignition set fitted to an 8 h.p. Royal Enfield motor cycle.

THE PORTSMOUTH ROAD. Near Esher. For the benefit of our readers in the North and elsewhere, this is where the originals of Helen McKie's sketches in "Facial Expression on the Road" may (or may not) be found any fine Saturday afternoon. The article referred to was by "Ixion," and was published in our Spring Number and Buyers' Guide (March 17th).

he Extra Hour of Daylight.

Next week evening runs become more opular with the extra hour of daylight.

outhport Speed Trials.

The Southport Watch Committee has ecided not to sanction the speed trials hich the North-western Centre A.C.U. roposed to hold on the promenade in ily.

T. Entran's.

Frank Whitworth, Ltd., have entered vo riders for the T.T.—one for the unior Race on a 3 h.p. Ivy.

cottish Six Days Reliability Trial.

The arrangements for this trial are now ell in hand, and the date is definitely xed for the 11th to the 16th July, thus aking room for the St. Andrews Speed rials on the 9th of that month. The oute is not yet definitely settled, but the rganisers propose that two days be spent the vicinity of Oban, which district ounds full of promise. The route will e for the most part along the West of cotland, but has yet to be finally raversed by the organisers.

rivate Owners' Inter-club Team Trial.

Club teams of private owners only are ligible for the Surbiton and District M.C.C. inter-team trial, and for this eason the event has aroused considerable nterest in, and has been promised excelent support by, club-land generally. As special A.C.U. permit has been granted or the event, it is open to any club ffiliated to that body; only one team, owever, consisting of three solo riders nd three sidecarists, may represent each lub.

As last year, Maudes' Challenge Shield ill be awarded to the winning club, also old and silver medals to members of the econd and third teams.

The course—a secret one—is laid in urrey, and as the date of the trial has een advanced to April 30th, clubs inending to enter should communicate mmediately with the hon. trials secreary, Mr. W. Pratt, c/o Maudes' Motor lart, 100, Great Portland Street, London, W.1.

For this event, the term "private wner" has been defined as "one who is ot engaged directly or actively in the anufacture or sale of motor cycles or heir component parts." No A.C.U. ompetition licences are necessary.

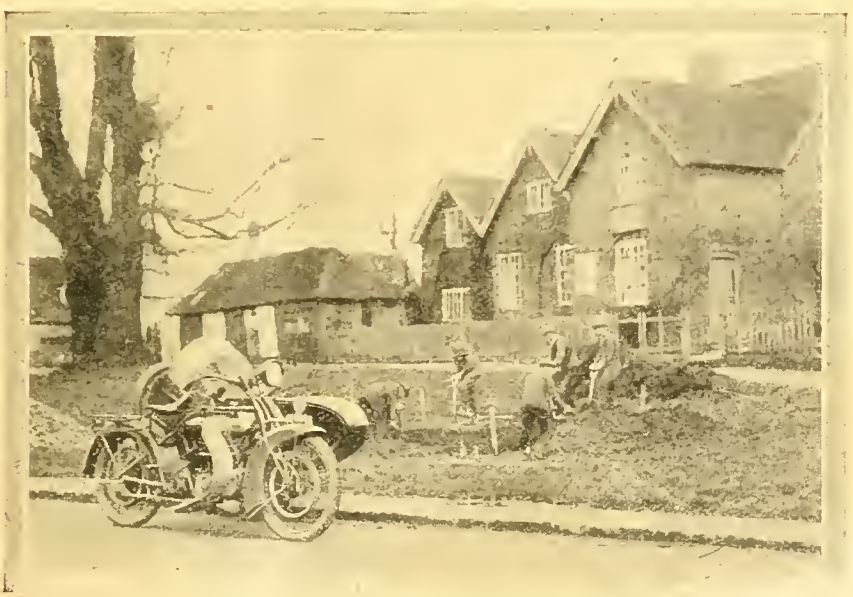
The Penalty of Greatness.

During last year's T.T. practising, it was not unusual to hear some comment to the effect that Nortons ought to win with so many entrants. Comparatively few people seemed to recognise the fact that the Norton is one of the few standard machines which are fast enough to encourage private entries. For 1921 the official riders who have the firm's assistance will be: Duggie Brown, V. Horsman, J. W. Shaw, N. C. Sclater, and H. W. Hassall. No other Nortons entered will receive help from the works. It is not without interest to note that the veteran designer, Mr. J. L. Norton, intends to tour South Africa, New Zealand, and Australia. He hopes to sail in August.

Dutch Motor Cyclists' Visit to England.

Preparations are now being made for the visit of the Dutch team to England next August on the occasion of the fourth Anglo-Dutch International Trial. A special sub-committee of the A.C.U. has the preparations in hand, and Mr. W. Cooper is acting as the hon. secretary to that committee. Several Midland clubs, including the Worcester, Birmingham, and Coventry clubs, have offered to share in the entertainment of our visitors, and it is possible that the leading works in the Midlands may be visited.

Special Features.



EASTER EVENTS.
THE LONDON-LAND'S END TRIALS.
OVERSEAS SECTION.

A.C.U. One Day Trial Regulations.

The official regulations for the A.C.U. One Day Trial for motor cycles and cycle cars, to be held on Wednesday, April 27th, 1921, have now been sent to the trade. Any manufacturers, agents, or private riders who have not received a copy of the regulations are invited to apply for one at once to the Secretary, Auto Cycle Union, 83, Pall Mall, S.W.1.

Trade Numbers in Competitions.

The Secretary of the Auto Cycle Union has received an official intimation from the Ministry of Transport that the Minister has approved the use by manufacturers of general identification mark licences on the motor cycles or cycle cars entered by them in competitions promoted by the A.C.U. or by other bodies under permit from the A.C.U. This means, of course, that all competing vehicles directly entered by the trade will be allowed to bear the new official trade number whilst they are competing in open competitions under A.C.U. rules.

Digging the site for the "Cyclists of England" War Memorial at Meriden (regarded as the centre of England) on the Coventry-Birmingham road. The sidecar outfit is a 6 h.p. B.S.A.

CLUB NEWS.

Forthcoming Club Events.

April 2.—Stourbridge M.C.C. Captain's Run.
April 2.—Dewsbury and District M.C.C. Competition.
April 2.—Public Schools M.C.C. Surprise Competition.
April 2.—Cheltenham C., M.C., and L.C.C. Opening Run.
April 2.—North Wales M.C.C. Reliability Trial.
April 2.—Herts. M.C. and L.C.C. Opening Run.
April 2.—Portsmouth and District M.C. and L.C.C. Club Run.
April 3.—Eastbourne and District M.C.C. Opening Run.
April 3.—Reigate, Redhill and District M.C.C. Club Run.
April 3.—Bradford M.C. and L.C.C. Triumph Cup Trial.
April 3.—N.W. London M.C.C. Opening Run.
April 3.—Worcester and District M.C.C. Opening Run.
April 3.—Newcastle and District M.C. Novices' Reliability Trial.
April 3.—Leeds and District M.C. Club Run.
April 3.—Sheffield M.C.C. Club Run.
April 3.—Halifax and District M.C.C. Club Run.
April 3.—Ilkeston and District M.C.C. Club Run.
April 6.—Plymouth and District M.C. and L.C.C. Hill-climb.

IMPORTANT club and OPEN events are tabulated on the "Questions and Replies" page.

Marlow and District M.C.C.

Although the weather was unsettled a run to Windsor on the 20th inst. was much enjoyed.

Coventry (Triangle) M.C.

In spite of uncertain weather there was a good attendance at the opening run and paperchase on the 19th inst.

Cheltenham C., M.C., and L.C.C.

All members and potential members are invited to attend the opening run on Saturday. The venue is the Swan Hotel, Bibury.

Hartlepool M.C.

Important changes in the constitution of the club took place at a recent general meeting. Mr. G. H. Wheeler, 2, Anncliffe Gardens, West Hartlepool, is now secretary.

Wolverhampton M.C.C.

A good muster turned out for the opening run under the captaincy of Mrs. J. E. Greenwood, and enjoyed an excellent run. This year several prizes are offered for the best aggregate attendance at outdoor club events.

North London M.C.C.

The run to Bishop's Stortford was carried out successfully, in spite of strong head winds and a heavy storm which failed to damp the ardour of those members taking part. A watersplash caused some amusement near Bishop's Stortford, but everyone managed to get through, and an excellent lunch was followed by an impromptu musical programme.

South Midland Centre A.C.U.

Following on the meeting at the R.A.C. a week earlier, clubs in the projected South Midlands area were invited to send delegates to a meeting at Luton on Saturday. Only six clubs (the necessary quorum) were represented, but from others letters were received promising support, although owing to short notice they could not be represented. Mr. Pooley presided, with Mr. Iveson as acting secretary; and, after considerable discussion as to the advantages to be gained by forming a district centre, it was unanimously resolved to make formal application to the A.C.U. for a South Midlands Centre to be constituted. A further meeting was fixed for Saturday, April 30th.

Leeds University M.C.

On Wednesday, March 9th, the Leeds University Motor Club held its first hill-climb, which took place on Thornthwaite Brow. The results were:

350 c.c. CLASS.—1, G. Hardy (2¾ Douglas), 39⅗s.; 2, C. R. Perritt (2¾ Douglas), 45⅖s.

500 c.c. CLASS.—1, A. W. Gregory (3½ Norton), 32⅖s.; 2, R. F. L. Gosling (3 A.B.C.), 34⅘s.

750 c.c. CLASS.—1, R. F. L. Gosling (3 A.B.C.), 32⅘s.; 2, A. W. Gregory (3½ Norton), 34⅘s.

750 c.c. SIDECAR CLASS.—1, H. Marriott (4 Triumph sc.), 1m. 4s.; 2, A. F. Plummer (6 A.J.S. sc.), 1m. 27⅕s.

1,000 c.c. SIDECAR CLASS.—1, W. Hallett (8 Zenith sc.), 47⅗s.; 2, A. F. Plummer (6 A.J.S. sc.), 1m. 23⅗s.

CAR CLASS.—1, T. Moore (G.N.), 56⅕s.; 2, J. Watts (G.N.), 1m. 3⅕s.

R. F. L. Gosling made an excellent climb on his A.B.C., making fastest time of the day.

Tamworth and District M.C.C.

About fifty members and friends sat down to the first annual dinner on the 9th inst. Prizes were distributed to the winners of last year's events by the hostess, Mrs. A. Ison.

Manchester M.C.

The opening run on the 20th inst. took the form of a speed-judging competition, the distance covered being about twenty-four miles. The attendance was quite good, taking into consideration the adverse weather conditions prevailing early in the day. The results were as follow: 1, A. E. Cope, error 55s. early; 2, J. P. Wigley, error 1m. 8⅗s. early; 3, J. D. O'Hanlon, error 1m. 23s. early. The three winning competitors will be awarded club medals.

Bath and West of England M.C.

A twenty-four-hour reliability trial to Land's End and back resulted as follows: Winner of the Young Cup, E. W. Spencer (4 Omega); winner of the Catley Cup, A. E. Sims (4 Norton sc.); silver medal, L. G. Williams (3½ Norton).

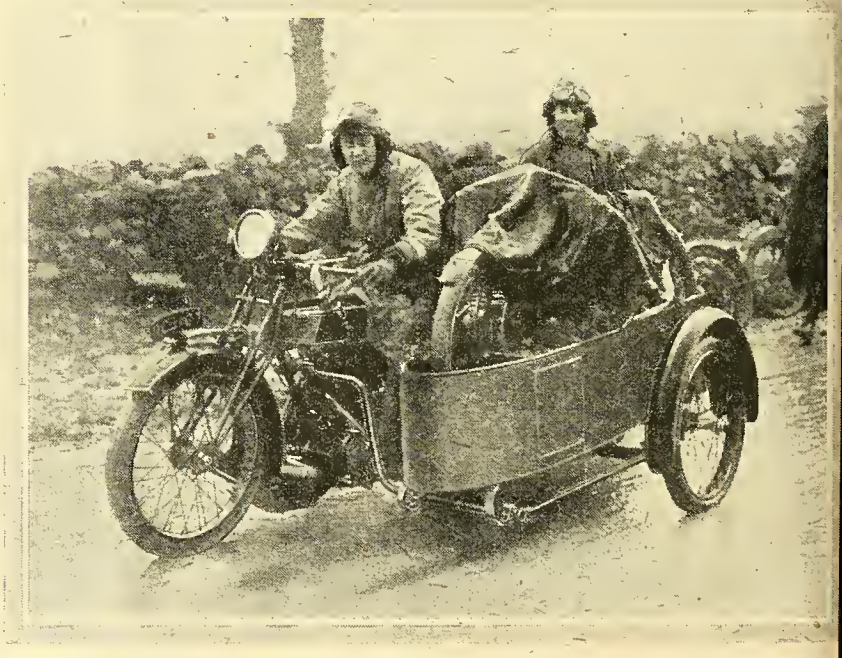
Banbury and District M.C.C.

At the adjourned meeting of the club a small but enthusiastic attendance decided to carry on the club under the new A.C.U. rules. A challenge from the Oxford M.C. to an inter-club hill-climb was accepted.

Loughborough and District M.C.C.

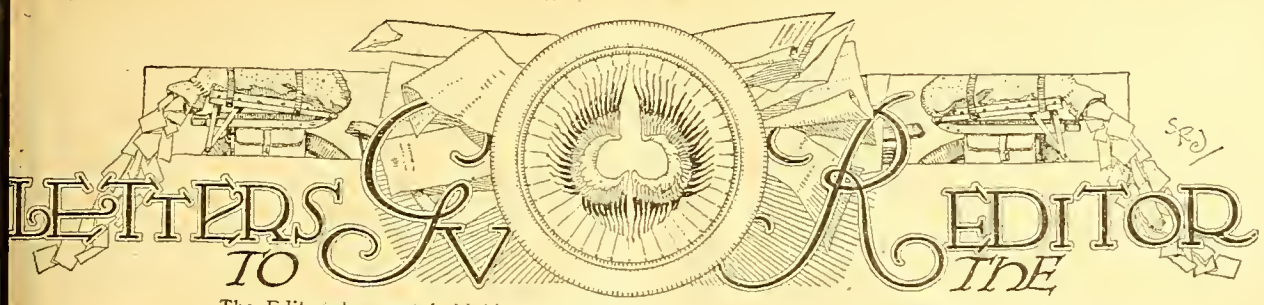
Over a hundred members—a record turn out—attended the speed-judging competition on the 20th. Results: 1, F. Bennet (2¼ Velocette); 2, H. J. Chambers (4¼ B.S.A. sc.); 3, E. Norman (2 Radco).

North-west London M.C.C.



By special request of the Auto Cycle Union, the London-Gloucester Reliability Trial provisionally arranged for Dec. 31st will be promoted as a joint event with the North London M.C.C.

Worcester and District M.C.C.



On the occasion of the opening run on the 3rd prox., it has been arranged to meet other clubs in the Western Centre to discuss the forthcoming Two Day Open Reliability Trial.

Wellingborough, Rushden, and District M.C.C.

A most attractive programme has been arranged for the next three months, and local motor cyclists wishing to participate should communicate with the hon. secretary of the club, Mr. W. A. Fathers, at the Angel Hotel, Wellingborough, or the Victoria Hotel, Rushden.

SPECIAL PRECAUTIONS. A competitor's machine being transported to the Stockport Open Hill-climb by a lady driver of a Sunbeam.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

DEFINING "SILENCE."

Sir,—Living in the Bromley district, I should be very much obliged if anyone could give me some advice. Have we no redress when our silencers are just as they left the makers of standard machines? Round here we feel as if we may as well give up motor cycling owing to the way in which we are persecuted. Personally, I have not been trapped yet. E. A. GURNEY-SMITH.

CLASSIFYING COMPETITION RIDERS.

Sir,—Your correspondent on the above subject touches a query that would be better squared up at once. Last season I enjoyed a certain amount of success as an amateur, and was then classed as an expert (I had no connection with the trade).

In some events no distinction was made between the amateur and trade rider, and in others a distinction was made, but again the real amateur on a standard machine had the dissatisfaction of having to compete against the amateur having a special machine, which he (the first amateur) could not purchase. My own opinion is to ignore the question of trade and amateur trade rider altogether, and to class as an expert or amateur. L. MITCHELL.

Sir,—May I be permitted to endorse heartily the remarks contained in the letter of your correspondent "Etaples"? The suggestion put forward is an excellent one and would, I feel sure, give an added interest to competitions and reliability trials from a non-competitor's point of view.

Many motor-cyclists judge the capabilities of a machine by the performance put up by it in the big events of the year, and are consequently guided to a certain extent by these performances when making a selection; it is therefore in their interests that it should be made quite clear if it is an amateur who does well, since every motor cyclist feels that what the average rider can do he can do. Whilst if it is a trader rider who distinguishes himself, one hears vague remarks ment "special tuning" or "the makers behind him," and to many the names appearing in the award lists convey nothing, be the rider trade or amateur.

Another point in favour of this suggestion, which "Etaples" appears to have overlooked, is that the adoption of it would help to place motor-cycling on a par with our other national sports, which, as I think everyone will agree, is very desirable. ENTHUSIAST.

Bishopsgate, E.C.2.

ORGANISATION AND CO-OPERATION.

Sir,—I am surprised that you should have allowed the statement that I signed my approval of the new scheme of taxation, made by "A.A. 282590" in your issue of the 17th to have been published without comment.

Every credit is due to the A.A. for its strenuous fight on behalf of all motorists against the present unjust system of taxation. Equal credit is due from every motor cyclist to the A.C.U., which stood shoulder to shoulder with the A.A., and, when the Government flatly refused to continue the petrol tax, succeeded in getting for two and three-wheelers far more favourable terms than those now imposed on either private or commercial cars.

To state that I signed my approval of the new scheme is a *gross perversion of the facts.* The A.C.U. has fought for the petrol tax from the start, and to-day, in company with the A.A., is fighting for its re-imposition in place of the present unjust and unfair system.

Your Cambridge correspondent rightly emphasises what is the chief, but too often unappreciated, object of such organisations as the A.A. and the A.C.U. But he is obviously ignorant of the work of the Motor Legislation Committee, and of the fact that "organisation and co-operation"—his slogan—are its watchwords. It will be news to him that on this committee the A.A. and A.C.U. work together.

The interests of motor cyclists, equally with those of all other classes of motorists, have had the careful consideration of every member of the M.L.C., but have been more particularly watched over in that committee by the A.C.U. and the Manufacturers' Union, the two organisations that are concerned solely with this class of road user.

To imply, as does your correspondent, that the A.A. is the only body that has recognised its duty in this matter is grossly unfair to the other members of the M.L.C., as the A.A. would be the first to acknowledge.

Letters such as that from "A.A. 282590" only hinder that co-operation amongst all motor cyclists that to-day is so vitally necessary. T. W. LOUGHBOROUGH,

Secretary A.C.U.

WAS IT ENGINE SEIZURE?

Sir,—I was riding a 1920 4 h.p. belt-driven Triumph solo, with a friend on the Tan-Sad, and, having taken a small hill on two-thirds throttle (full air always) at about 30 m.p.h., I left the throttle as it was for the approaching level. We were soon doing 50 m.p.h., when suddenly the engine stopped, the back wheel locking in consequence, but our momentum was evidently sufficient to drag the wheel, and by the time we were going slow enough to upset I had declutched. The first thing I thought of was seizure, so put the machine on its stand, and tried to turn the engine over with the kick-starter. At first it would not move, but, after priming very gingerly and leaving the compression tap open, I persuaded it with a terrific heave, and kept it moving for a couple of minutes. We had not then done more than three miles, and it had already had three pumpfuls of oil (one at the bottom of the hill). I had borrowed the motor cycle, and oiled so copiously to avoid seizure. As we were in a hurry, I did not stop to inspect, but the cycle is in perfect order now, and, indeed, it touched 50 m.p.h. that same evening. It started easily, and ran the rest of the journey faultlessly. Now, what was it? F.L.S.

Derby.

SIDECAR OR CYCLE CAR?

Sir,—May I through the medium of your world-wide journal express a few opinions *re* "Sidecar or Cycle Car"?

At the present time the sidecar outfit practically holds the field, with a few exceptions. Perhaps the reason may be attributed to the fact that in years past far many more firms built motor cycles and cycle cars.

Of late there has been quite an amount of controversy and wrangling as to whether the cycle car of the four-wheeled type should be allowed in open competition with the motor cycle and sidecar. To many of us it would suggest "wind up" on the part of motor cycle manufacturers.

Undoubtedly, the days of the luxurious sidecar outfit are numbered. The stop gap between the £150 motor cycle and sidecar and the £250 light car is the cycle car. The next two years will see the cycle car holding its own with all and sundry. As a motor cyclist of seven years' experience, under varying conditions, I have had my fill of bad weather riding. PUP III.

Letchworth.

Sir,—I quite agree with the writer of the article "Sidecar or Cycle Car," that the latter by no means has all the advantages over a sidecar outfit. I would like to get a cycle car, a "side-by-side" four-wheeler, the only kind worth considering against a sidecar, but am "choked off" by the apparent discomfort of the seating accommodation afforded.

Your correspondent, Mr. F. E. Schofield, says that the successful sidecar must possess simplicity, reliability, and good construction. To these I would add comfortable and convenient side-by-side seating. The occupants of the various makes of this class of car one sees look as if they were sitting on the floor, or lying on their backs with their heads propped up. These positions may be comfortable and convenient for the supple joints of youth, but certainly not for the middle-aged.

Moreover, when two average sized people are seated side by side they give the appearance of having got in with the aid of a shoe horn. The reason for this extreme lowness of the seat seems to be to enable the bonnet to be utilised as a windscreen, and so save a trifle by eliminating that accessory or reducing it to almost vanishing point. Surely this brings the face of the occupant nearer the mud splashes of passing vehicles than the seat of a sidecar would. Personally, I would rather sit two hours on a motor cycle saddle than one in a cycle car; but then I am no longer young.

Another drawback is the excessive shaking of the bonnet and long mudguards, due apparently to flimsiness in construction such as lack of supporting stays or fastenings. I have several times seen the extremely long front mudguards almost flapping when the car is in rapid motion. Why are they made so long, and why placed so far from the tyres? Is it to allow for their movement? Surely two or three inches added to the height and width of the seat would not materially add to the cost. TWO-STROKE.

Worthing.

CARBIDE PRICES.

Sir,—With reference to "Trader's" letter of March 10th, *re* the carbide bogey. I am not in any way connected with the trade, but buy retail one drum of carbide every six weeks, for lighting purposes. This carbide is uncoated, and small enough to fill into a Lucas rear light generator, and dark in colour when the drum is opened. I have yet to find more than a 1 lb. carbide tin full of dust when the drum is empty at the end of six weeks. The quantity is so small that I don't even spray it with paraffin or light oil.

The price I pay is 40s. per cwt.; this works out at under 4½d. per lb. I should like to know why this carbide could not be sold, coated in 1 lb. tins, at 9d. to 10d. per tin, and at the same time yield the retailer a profit of 25%. Perhaps this is not good enough whilst motor cyclists *will* pay.

West Didsbury. MOONSHINE.

DISCOURAGING PRIVATE OWNERS IN CENTRE EVENTS.

Sir,—To those who have never taken part in a motor cycle competition or closely observed one, it may seem that, as a form of sport, it cannot equal, say, rowing, golf, or even pedal cycling; but the fact is that the combination of skill and nerve necessitated by the delicate control of a machine which is almost too susceptible to human adjustment, makes competitive motor cycling one of the finest, if not the most fascinating, of our out-door sports. Like other forms of sport, motor cycling has suffered from the successful attentions of the professional, and many motor cyclists have refrained from entering local events, because they have felt that, in comparison with the accomplishments of the experts, theirs would be but a sorry performance.

The recent decision of the A.C.U., however, to allow the members of any number of clubs within an A.C.U. local centre to compete together without there having to be obtained an open permit, with all its attendant formalities, should go far to revive the enthusiasm of the genuine private owner for the sporting side of the movement. An influx of "foreign" track riders, many of whom are members of clubs all over the country, would defeat the object of such local centre trials or hill-climbs, which should be promoted to encourage the sport locally, and not to provide opportunities for booming particular makes of machines nor to replenish the coffers of any particular club. If the old A.C.U. rule prohibiting "extensive advertising" of the results of any competition other than an open competition is loyally observed by both competitors and the trade, there will be no danger of the entry list being swamped by professionals, the local aspect of the competition will be enhanced, whilst the open competition proper will gain in importance from the trade point of view.

Some of our old-established clubs, whose nominally "closed" events have become historic, may at first object to any of the publicity such as their competitions have secured in the past being curtailed. But, on reflection, they will probably agree that to obtain a good press report of their trial—which is, of course, quite legitimate—is a much finer tribute to their sport-promoting abilities than a host of advertisements stating that such and such a machine won a gold medal. It may reduce their often too-swollen entry list.

London, S.W.1. LICENCE HOLDER.

HOMELY HINTS.

Sir,—The following hints may be of interest to some of your readers:

(1.) It is an easy matter to compress valve springs in a trousers press in order to tie them before putting on machine.

(2.) A sparking pistol (called "Shoot-a-Lite"), which is sold for lighting gas stoves, etc., is equally useful for acetylene lamps, and obviates trouble with matches on a gusty night. A. SIMONS.

REDUCING SECOND-HAND VALUES TO A FORMULA.

Sir,—On applying Mr. Frank Hall's formula to several of my friends' machines, including my own, I came to the conclusion that the prices arrived at were too high, especially when the present state of trade is considered. I think the following modification would be nearer the mark:

$$V = x\left(\frac{y-1.3}{y}\right)^n$$

where V = the value of second-hand machine minus the unexpired value of taxation. A.R.A.

Carlin How.

BELT DRIVE.

Sir,—I am writing regarding the letter published in a recent issue of *The Motor Cycle* concerning belt wear, and hold the same opinion as the writer. I have never had any trouble with belts through faulty driving. I was sorry indeed to part with my Zenith when I came back from France, having been in hospital for three months, and I have not been able to have another. I prefer the hand pump lubrication, for in France we had much trouble with drip feed, especially in winter and on rough roads. Chain troubles used to hold me up for hours, often tearing off the chain cover and putting the back wheel drive out of order. Often I wished I had my Zenith in France with me. I enclose a snapshot of my late outfit. GEO. LOCKE, Ex-D.R.

Mr. G. Locke, who praises the belt-driven Zenith. (See above letter).

ELECTRICAL PHENOMENON.

Sir,—I have a Saltley-Villiers two-speed two-stroke fitted with a C.A.V. magneto, which, by the way, is quite in order. A short time ago I broke the high-tension lead from the magneto to the plug. As at the time I had about a yard of flexible with me, I jointed up the broken piece on the magneto and then coiled all the slack wire round the right-hand bearing. I connected up to the plug and then re-started; but found that I had to push the machine nearly as quickly again to get a good spark, whereas before I had only to paddle off with it and it started easily. I managed for a few days with it, but eventually I uncoiled the length of wire from round the bearing, and cut it just long enough to reach the plug. Then I tried the machine again, and found that it started as easily as before I broke the wire.

I can only account for this phenomenon by surmising that as a magneto generates a single phase alternating current it is highly probable that the high-tension wire coiled round the bearing caused a choking coil effect, using the driving shaft as the iron core, and thereby diminishing the current value at the plug terminal. I may say that the insulation of the coiled flexible wire was perfect throughout its length. I should be obliged to know if any of your readers have met with this elusive fault. N. H. BAILEY.

BRITISH MACHINES IN SWITZERLAND.

Sir,—In one of the recent issues of your paper you published a lament by a Swiss correspondent about the lack of English machines in Switzerland. This may be so in the canton of Geneva, where your correspondent resides, but in this canton (Vaud) every second machine is a Douglas, and practically all of them are post-war models.

The popularity of the Douglas is largely due to the live local agent, who rides and races the machines which he sells.

I have also seen in this country Humber, Verus, Ariel, Triumph, James, Royal Enfield, Scott, and A.J.S. machines. American makes are comparatively scarce, Indians mostly; but I have seen Thors and Harley-Davidsons. The general opinion, I think, is in favour of English machines.

The best Swiss motor cycle, the Motosacoche, is almost as popular as the Douglas. It is really a modified Royal Enfield with a M.A.G. engine. Other Swiss makes are Condor and Moto-Rêve.

The only other agent for British machines in these parts represents the A.J.S. and Verus firms.

I take exception to the idea of importing Brough-Superiors for Swiss sportsmen. The majority of Swiss speed merchants are road hogs, and, consequently, less dangerous with a $2\frac{3}{4}$ h.p. Douglas, than a big o.h.v. twin.

Hoping you will find space to publish this protest against the wholesale condemnation of the British export system,

Vaud, Switzerland. SUREV.

THE EINSTEIN THEORY OF RELATIVITY.

Sir,—I should like, if I may, to congratulate you on your courage in reprinting Mr. Bolton's prize essay on the Einstein Theory of Relativity, and to make one or two observations suggested by it.

I wonder how many of your regular readers read it through, and what proportion of those understood it. Undoubtedly, it is difficult to grasp, but it need not have been so difficult but for the conditions. Mr. Bolton has done wonderfully well in trying to accomplish an almost impossible task—to explain a mathematical theory without being allowed the use of formulæ. It is like trying to make an omelet, not merely without breaking eggs, but with egg powder instead of eggs. It is true there are no formulæ, but, none the less, the whole essay is pure mathematical physics.

Is it not rather a slur on our boasted education that the ordinary Englishmen must be assumed to be entirely ignorant not merely of the calculus (the only mathematics of any real use in science), but even of the A B C of elementary algebra and trigonometry. No such assumption would, as a rule, be made in France, Germany, or Italy. Here men claim to be mechanics, even engineers, who regard such a statement as $y = e^{ax}$ (or $y = \frac{dy}{d.x}$, which is the same thing) not as a fundamental scientific law (the "compound interest" law), but a meaningless assemblage of three or four letters of the alphabet. The fact is that we are so intensely practical a people that we have a kind of horror of any abstract idea. The only rule we believe in is the rule of thumb.

That all sound mechanical practice must be founded on sound theory and mathematics is the one key to unlock and elucidate that theory. Much of the so-called "higher" mathematics, *i.e.*, what we have discovered in the last 200 years, is not really difficult (though, apparently, simple problems such as the time of a swinging pendulum take us into the depths at once), and it is immeasurably more interesting than the common or schoolboy's variety. The late Professor Sylvanus Thomson, in his "Calculus made Easy" (Macmillan), made the subject entertaining, and even amusing. But then he admitted he had left out all the difficult parts.

To get any real idea of so epoch making a theory as the Theory of Relativity (including the famous Michelson-Morley experiment) without some knowledge of mathematics is impossible. People are already writing to the papers to say that Einstein's theory is utterly incredible; it is simply because they cannot understand it. It is rather futile to tell people about "Gaussian" co-ordinates, when they do not know the common or rectangular co-ordinate, and would not recognise a definite integral if they saw one. We have a lot to learn yet.

It is significant that when Mr. Garrod produces a spoof formula to determine the legal speed limit in any area he feels obliged to use the × to indicate multiplication, which mathematicians abandoned ages ago. The result is that the denominator may mean $(w^2 + d)re$ or $w^2 + dre$.

H. L. LEWIS.

SUMMARY OF CORRESPONDENCE.

With reference to the "Sidecar or Cycle Car" controversy, "J.G.D." writes in praise of the comfort and performance of his Tamplin cycle car. Belt trouble he has never experienced.

"W.W.," writing in support of the suggestion to differentiate between trade and amateur riders in competitions, also states that long exhaust pipes are dangerous fitments in Cardiff and district.

Mr. G. F. Ackland Johnson has a ready solution to the alleged superiority of American big twins in the matter of speed. "Superior design" is how he explains it.

As a result of his letter on the subject of rebalancing a two-stroke, Mr. R. E. Coleridge received a number of queries regarding fitting an aluminium piston. For the benefit of these correspondents, he now writes that the piston was obtained from the Laystall Motor Engineering Works, Ltd., 34, Queen Street, E.C.4, who gave him every satisfaction.

The conversion of hub-geared machines to countershaft models is a subject that excites considerable interest. Mr. Clarence F. J. Searle reports entire satisfaction with the conversion as carried out on his Rover by the Sheldon Engineering Co., Coventry.

A correspondent, signing himself "Cato," asks why an increased insurance premium should be demanded for pillion riding when a sidecar is attached. He also complains of the totally inadequate tool-rolls supplied with many expensive machines.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	Book post.
"HINTS AND TIPS FOR MOTOR CYCLISTS" Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition	2/	2/3
"TRACING MOTOR CYCLE TROUBLES." A system for tracing motor cycle faults and of remedying them when found. Fourth Edition ..	2/-	2/3
"MAGNETOS." By A. P. YOUNG. A complete treatise on magneto ignition for motor cars, motor cycles, and aeroplanes. Second Edition	4/6	4/10
"TWO-STROKE MOTOR CYCLES." A reliable treatise on Two-strokes, from the rider's point of view. Just published	3/-	3/3
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle*	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS, England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District ..	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects

DISMANTLING FLYWHEELS.

Will you please furnish me with the following particulars of a B.S.A. engine (1912): (1.) How can I separate the flywheels to rebush the big end? How are they fastened? (2.) What size jet is best suited for use with benzole? (3.) What causes knocking over 30 m.p.h.? The engine is in perfect condition, as laid down in the makers' manual.—F.H.

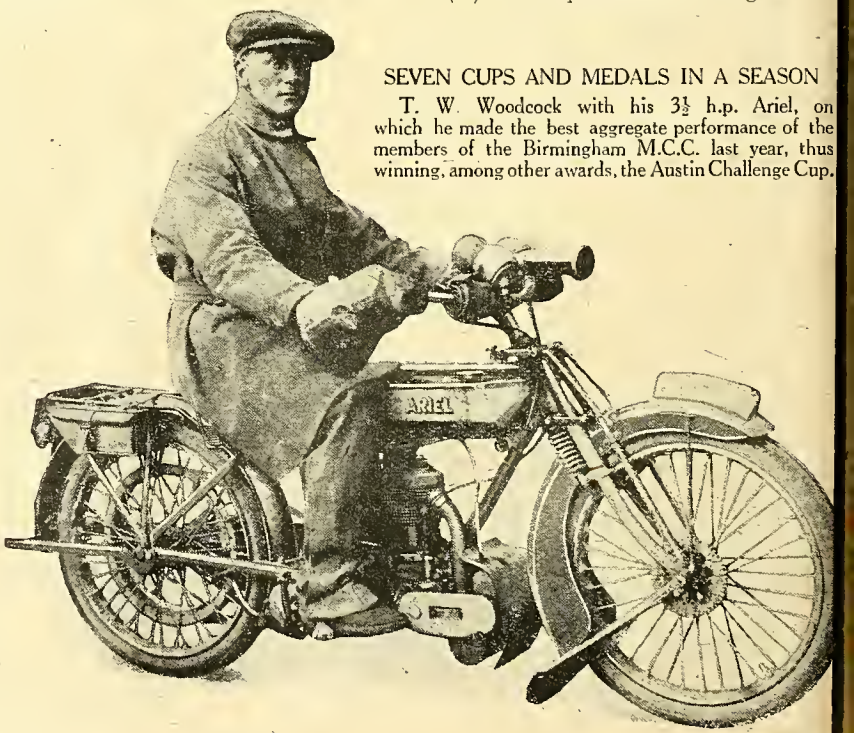
(1.) The flywheels are secured by the crank pin, which is riveted on one side and held tight in a taper hole by a nut at the other. After removing this nut the flywheels may be separated by the use of wedges. (2.) A 30 jet. (3.) The knocking may be due to wear in the connecting rod bushes, especially as it only occurs at fairly high speeds, when, presumably, the engine is running light.

A SINGLE TRACK MONOCAR.

(1.) Would it be possible to drive a monocar built on motor cycle lines, with one front wheel and one back wheel, and one wheel each side of the body, which would be let down by a foot control for getting away (*i.e.*, balancing speed, and for stopping? After balancing speed had been attained the side wheels would be taken off the ground by the control. The control of the machine would be on the Maurice Farman aeroplane principle, and the driver would be more or less in a lying down position. When banking or turning, this control would come more natural than the ordinary handle-bar form when in this position. (2.) If this is possible, why has it not been used before? It has so many advantages, both over the motor cycle and over the four-wheeled monocar. It would be *very* comfortable only having the two wheels in contact with the road, while the expense to build and to run would be less than the 5-6 h.p. motor cycle. A spring chassis would also be very easy to fit.—S.H.S.

It would no doubt be possible to drive a monocar built on the lines you suggest: in fact, such designs have been carried out by various experimenters from time to time. The great objection lies, of course, in the fact that at very slow speeds, in traffic, or in the event of a sudden skid, the driver has not nearly so much control over the vehicle as he has over a motor cycle of a conventional pattern.

STARTING TIPS.



(1.) In starting my Rudge, which has a Senspray carburetter, I close the air and give about one-third gas, and find starting rather hard. In driving, I am told to open the air fully and drive on the gas. Is this correct? (2.) Is this carburetter suitable for benzole? (3.) What is the most suitable oil for this machine, and how often should the pump be actuated?—E.F.G.

(1.) When starting, keep the ignition fairly well advanced; also open the throttle slightly less—try about one-quarter. An injection of petrol in the cylinder or induction pipe will help matters. The makers will fit an injection tap in the induction pipe for quite a small charge if you return it to them. With this carburetter you can keep the air lever fully open almost the whole time, but it may be necessary to close it slightly when running slowly or when hill-climbing. (2.) Benzole will be quite satisfactory; but you might find it necessary to fit a slightly smaller jet or to lower the level a little. (3.) A good quality oil of medium body is most suitable. About one charge for every eight miles.

COMPLETING A PURCHASE.

A short time ago I selected a motor cycle at a dealer's, and paid a deposit of £4. Since then circumstances have arisen which prevent me completing the purchase. I have written to the dealer in question explaining the position, and offering him to deduct something for his trouble, but he absolutely refuses to refund the deposit, or to allow me to select goods to the value. I should therefore like to know: (1.) Am I compelled to complete the purchase? (2.) If so, can I refuse any other than the machine I selected? (3.) If I agree to forfeit the deposit, can he force me to purchase? (4.) Is he within his rights in refusing to return the deposit?—R.

(1.) The payment of a deposit constitutes a contract to complete the purchase, and if the dealer chooses he can take legal steps to compel you to do this. (2.) If the dealer accepted the order for a particular machine he certainly cannot compel you to take any other. (3.) If the dealer agrees to accept the forfeiture of the deposit, the matter will then be ended. (4.) He is quite within his rights.

SEVEN CUPS AND MEDALS IN A SEASON

T. W. Woodcock with his 3½ h.p. Ariel, on which he made the best aggregate performance of the members of the Birmingham M.C.C. last year, thus winning, among other awards, the Austin Challenge Cup.

WONT STOP ON THROTTLE.

A two-lever Amac carburetter is fitted to my 2¾ h.p. Douglas, and the running of the machine is perfect, the only trouble being that it is impossible to throttle own. When I close the throttle the gine slows, but still keeps running, d will keep running until I lift the haust lever. I have tested the gas d air slides and fitted new springs, so have adjusted control wires but no avail.—H.D.

iously, if the engine will not stop n the throttle control lever is in the closed position, there is some conrable leakage past the throttle itself. s may be due to the throttle being ly worn, or to the fact that it does close down completely. We would gest that you remove the carburetter n the induction pipe, when you will ble to see at once whether the throttle es right down. In its fully closed tion it should rest on the small form which contains the five spraying at the base of the mixing chamber. s just possible that the trouble is due he control wires being carried round ome position at a very sharp angle. —

WIN IGNITION AND VALVE TIMING.

I have a 1912 6 h.p. Rex and sidecar which has run very well until recently when one morning on attempting to start the engine it could not be pulled er. Thinking a tooth had broken and mmed in the gear wheels I took them wn but found nothing there, so took e front cylinder off and found an old tter pin on the crank case platform d the piston down on top of it, of urse preventing the piston going down s full distance. I put the engine gether again and can get the back linder and magneto timed correctly, it cannot get the front cylinder ght. The magneto is marked 48°, the rminals 1 and 2 and the contact eaker 1 and 2. 2 is leading to the ont cylinder and 1 to the back; is this rrect? Is there any rule for timing e valves to coincide with the ignition? hen I have the back cylinder valves d magneto right, the front cylinder haust is open when the magneto arks.—G.H.B.

e the engine as follows: Rotate the heels until the piston of the back nder is at the top of its stroke, then rt the cam wheel so that the exhaust e is just closing and the inlet valve commencing to open. Rotate the ne forward one full revolution, plus angle between the two cylinders; this bring the front piston to the top of stroke, and the corresponding cam el and valves should be inserted in same way. Rotate the engine still her in the same direction until the piston is again on top dead centre. s is the firing point for this cylinder, the sparking plug should be connected he No. 1 terminal of the magneto. rocker arm of the contact breaker ld be just touching the correspondy marked segment, the ignition con being two-thirds retarded. The firing t of the front cylinder will then be matically correct, and it will occur full revolution plus 48° after the g point of the back cylinder.

RECOMMENDED ROUTES.

ALFORD TO RIPLEY.—P.C.

Alford, Ulceby Cross, Spilsby, Turnby, Tattershall, North Kyme, Anwick, Sleaford, Ancaster, Barkston, Grantham, Bottesford, Bingham, Nottingham, Nuthall, Eastwood, Codnor, Ripley. Approximately 86 miles.

DERBY TO MOLD.—H.B.D.

Derby, Duffield, Belper, Ambergate, Cromford, Matlock Bath, Matlock Bridge, Rowsley, Haddon Hall, Bakewell, Ashford-in-the-Waters, Taddington, Buxton, Burbage, Macclesfield, Broken Cross, Chelford, Knutsford, Northwich, Hartford, Kelsall, Tarvin, Chester, Saltney, Broughton Church, Mold. Approximately 98 miles.

EXPERIENCES WANTED.

"K.D." (Edinburgh).—2¾ h.p. or 4 h.p. Coulson-B. Strength of frame, tank, and efficiency of springs; performance of Flexi carburetter and general reliability of machine.

"B.W." (Birmingham).—Method of cleaning a leather coat, or address of any cleaners who would undertake such work.

"H.G.Y." (Edmonton, N.).—Vickers-engined 8 h.p. Royal Enfield sidecar. Petrol consumption with twenty-stone load, reliability, and hill-climbing.

"F.S.B." (Eastbourne).—New Hudson 2¼ h.p. Popular model. Consumption, tyres, and absence of four-stroking.

Important Dates.

Sat. April 2nd—Essex M.C. Open Hill Climb.

Fri., April 8th, and Sat., April 9th—Western Centre A.C.U Two-day Open Trial.

Sat., April 16th—Yorkshire Centre A.C.U. Open Hill-climb.

Sat., April 23rd—Midland Centre A.C.U. Open Reliability Trial.

Wed., April 27th—A.C.U. One-day Trial

Fri., April 29th, and Sat., April 30th—Ealing and District M.C.C. London-Holyhead Open Reliability Trial.

Sat., April 30th—Newcastle and District M.C. Travers Challenge Trophy Open Reliability Trial

Sat., April 30th—Surbiton and District M.C.C Open Inter-Team Trial (Private Owners only).

Fri., May 13th, and Sat., May 14th—M.C.C. London-Edinburgh Run.

Sat., May 21st—Western Centre A.C.U. Open Hill Climb.

Wed., May 25th—A.C.U. Silencer Trial at Brooklands.

Sat., May 28th—East Midland Centre A.C.U. Open Hill Climb.

Tues., June 14th—Junior T.T. Race

Thurs. June 16th—Senior T.T. Race.

Sat., June 25th—M.C.C Inter-team Trial for "The Motor Cycle" Cup

Mon., July 11th, to Sat., July 16th—Scottish Six Days' Trial.

Wed., July 6th, and Thurs., July 7th—Arbuthnot Trophy Trial.

Sun., July 24th—Motor Cycle Grand Prix Race in France.

Mon., Aug. 1st, to Sa., Aug. 6th—International Six Days Trial in Switzerland

Mon., Aug. 29th, to Sat., Sept 3rd—A.C.U. Six Days Trial.

Sat., Sept. 17th—Grand Prix Race for Cycle Cars.

SPARKLETS

XL-All Saddles.

Famous for the comfort provided by excellent springing and anatomical shape, the XL-All saddles will henceforth be manufactured by John Leckie and Co., Ltd., of Goodall Street, Walsall. This firm has taken over the patents, goodwill, tools, and machinery necessary for the production of these accessories, and the plant is being moved from Hall Green, Birmingham, to the purchasers' new works at Walsall.

Magneto Repairs.

A special factory for dealing with magneto repairs has been equipped by the Fellows Magneto Co., Ltd., of Cumberland Avenue, Park Royal, Willesden, N.W.10. Not to keep a magneto more than twenty-four hours is the ideal set by this firm, but if this time is unavoidably exceeded the firm is prepared to loan a magneto to the customer. An inclusive price for overhauling motor cycle magnetos is quoted, no exception being made, however bad the condition may be, provided that they are complete and not damaged by fire. Small repairs not necessitating a complete overhaul are also undertaken.

Catalogues Received.

C. B. Harrison (1909), Ltd., Endurance Works, Sheepcote Street, Birmingham: A list of motor cycle components and parts, also the Endurance two-stroke engine, 68×72 mm., 259 c.c., 2.89 h.p.

Patrick Engineering Co., Ltd., Brearley Street, Birmingham: Price list, dealing with the Simplex motor attachment for bicycles, and the Motorped motorised cycle. Two pages of useful hints on management are included.

F. Aslett Coulson Eng. Co., Albion Works, Albion Street, King's Cross, London, N.1: Coulson-B. motor cycles are adequately described in the 1921 catalogue, which gives specifications of both 2¾ h.p. and 4 h.p. models.

W. H. Frost and Co., Ltd., 179, Colne Road, Burnley, Lancs: "Lubrication," a sixteen-page booklet, which contains some extraordinary claims for the efficiency of the W.H.F. system of engine lubrication.

Chater-Lea, Ltd., 74-84, Banner Street, Golden Lane, London, E.C.1: Fittings for motor cycles and light cars. An interesting catalogue dealing with motor cycle component parts, spring seat-pillars, and sidecar frames and fittings. Chater-Lea terminals are also described.

F.R.S. Lamps, Beam Works, Vere Street, Birmingham: As the name of the makers' works implies, the catalogue deals primarily with apparatus for the production of "beams"; in short, all manner of electric and acetylene lighting equipment is listed. Motor cycle horns are also produced by this firm.

The 1921 London - Lands End Run

M.C.C. Trial for the Jarrott Cup. A 314 Miles Route, including Timed Ascent of Porlock.

"LONDON to Land's End" is a magic phrase, and one which makes an appeal to the motor cyclist as alluring as the Spanish Main was to our forefathers. That is one reason why the M.C.C. annual Easter run to the south-western extremity of our island attracts such a large entry.

Of recent years the conditions have been made more and more severe in order to keep pace with the increased speed, power, and reliability of motor cycles, and this year a competitor had a difficult task to earn one of the coveted gold medals.

First organised in 1908, the London-Land's End Trial is one of the classic events of the year, and it is interesting to review past events since that date.

In 1908 the run was to Land's End and back, *via* Salisbury and Exeter, a six hours' rest being allowed at Penzance. There were only sixteen started, and ten retired. The Jarrott Cup was awarded to S. G. Frost, who rode a 4½ h.p. Minerva.

Double Journey Events.

The same course was utilised the following year, but a day and two nights were spent at Penzance, and sixteen survived out of twenty-four starters. The premier award went to F. G. Smith (3½ Triumph); and in 1910, over the same course, it was won by the late Admiral Sir R. K. Arbuthnot, Bart., R.N. (3½ Triumph), out of thirty-five starters and twenty finishers.

In 1911 the course was stiffened slightly. There were sixty-nine starters, and thirty-seven finishers, the winner being the late A. J. Moorhouse (7 Indian). Again, in 1912, the conditions were made more difficult, and eighty started, forty-four finished, and the winner proved to be H. Karslake (3½ Rover).

Bad Weather in 1913.

Bad weather was encountered in the 1913 event, which included a new route *via* Lyme Regis and Trow Hill. Ninety-five started and fifty finished, the cup being won by P. W. Moffatt (2¾ Douglas); while in 1914, under better weather conditions, there were 169 competitors and 108 survivors, and E. A. Colliver (7-9 Indian) won the trophy.

Last year saw the introduction of Porlock and Lynton hills, and the journey finished at Land's End; 161 started and 120 finished, with T. S. Sharratt (4 Triumph) the winner.

The difficulties of Porlock hill are known to every reader of *The Motor Cycle*. Those who have ascended it can realise what it means to take it "on the run" in a 20 m.p.h. schedule. But that was not all. The three miles commencing at the Ship Inn at Porlock had to be accomplished within ten minutes, *i.e.*, 18 m.p.h. This done, the competitors had to "carry on" over the none too good moorland road to Countisbury, and down this narrow dangerous hill on the face of the cliff to Lynmouth, proceeding up Lynton Hill—even worse than Porlock—to the summit, a total of twelve miles from Porlock village at an average speed of 19.4 m.p.h.

Severe Conditions This Year.

It will be recalled that *The Motor Cycle* has commented upon these conditions, and that an interesting controversy followed which made the sporting motor cyclist more keen than ever to participate; in fact, had the entry list not been closed, we were informed that the list would probably have been doubled. Two hundred odd competitors are quite enough to make a trial unwieldy, and, with this number only excellent organisation, for which the Motor Cycling Club is famous, could make the event a success.

THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

The Autocar

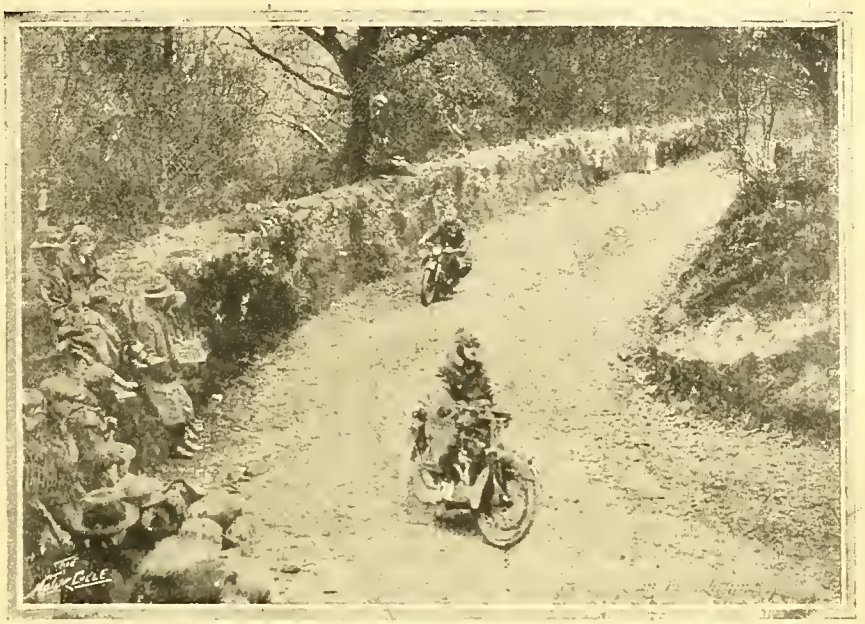
Every Friday 4d.

the forerunner of all motoring journals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

The 1921 London-Land's End Run.—

Many disconcerting rumours were current regarding the condition of the two hills, which, by some, were said to be unclimbable a few days before the start. We had visited both Porlock and Lynton a few days previous to the event, and found the condition of Porlock fairly good, but Lynton is rough in parts.

148 Motor Cycle Starters.



A brilliant night with a large white moon high in the heavens created a happy and essentially "springtime" atmosphere when the competitors assembled at Hounslow.

The usual last minute preparations impressed upon the onlooker the severity of the task. Many and varied were the methods of holding the route card.

Lamps were, for the greater part, electrically illuminated; the acetylene outfit, however, was conspicuous on the solo machines.

The first man was signalled to start by Mr. A. G. Reynolds at 10.1 p.m., the remainder following at one minute intervals, which, incidentally, means that the procession, including the light cars, was about seventy miles long. As each man left there was a rousing cheer from the large crowd. Many of the competitors shouted back a cheery good night and sped away to the first control at Bridgwater—130 miles away.

Little of note happened on through the night. Stretches of "gritty" road accounted for many "sprints" to clear the dust of the man in front, but with so many competitors at one minute intervals this was not easy. D. G. Bays, who had heroically attempted to bring through a single-geared Levis, was lost in the night; but the vast majority reached Bridgwater (the breakfast stop) as the darkness dispersed, although one or two were rather late owing to a fog that lay around Frome and onwards. Most of the competitors had a short wait outside the ancient town, having risked the lurking danger of a time check in the night.

J. Richardson (3½ Lea-Francis) followed by H. R. Harveyson (Indian Scout), both happy in reaching the last bend of Porlock.

Breakfast at the White Hart saw everybody in a very happy mood and generally confident that Porlock-Lynton would be "too easy"; alas for human hopes! Before all the sidecarists had breakfasted it rained, and rained very heavily—quite heavily enough to make even the leading men very glum before they branched off the Minehead road for Porlock.

On Porlock Hill.

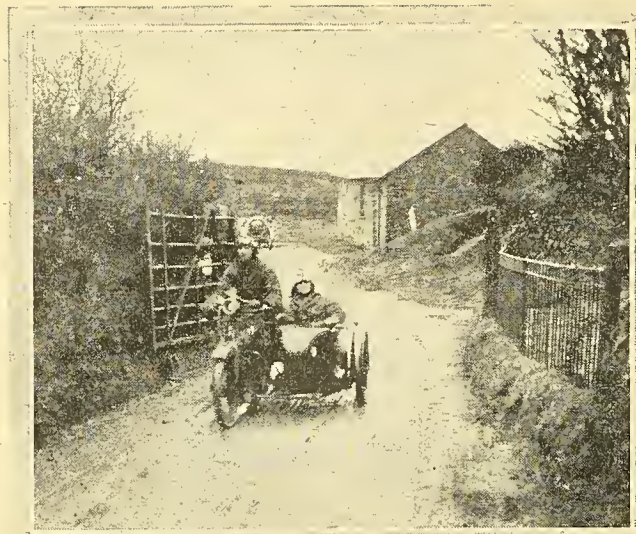
Porlock Hill was, of course, one of the chief difficulties of the trial. Rain in the night, and a steady drizzle since dawn had done their work in rendering the surface potent with unpleasant possibilities for the rider; but the corners had not reached the last stage of looseness.

It is a tribute to the wonderful popularity of the motor cycle that a large crowd of spectators had assembled on the hill at the early hour of seven in the morning.

Punctually to time, 7.5 a.m., the first batch of solo men was headed by V. Olsson (3½ Sunbeam), and the fun began. Some of the more powerful machines came up to the first corner at some speed, and, coming round a trifle too closely on the inside of the bend, started terrific skids, hitting the bank or charging the spectators first on one side, and then cannoning over the other before they could steady for accelerating up the steep straight to the second and left-hand hairpin.

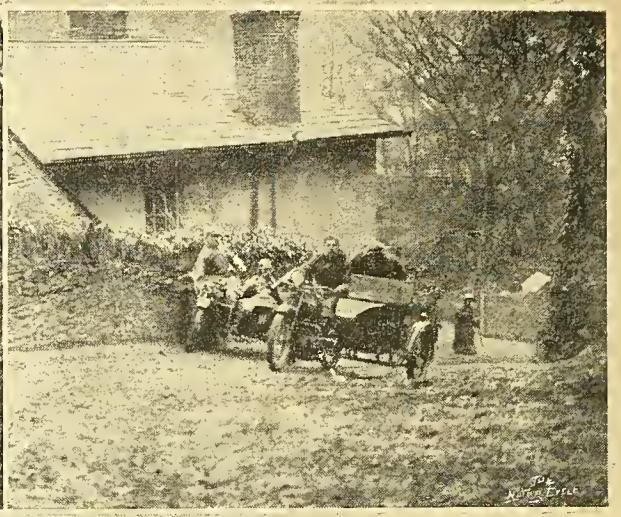
Watching some of these performances, it seemed miraculous that no one got hurt. It seems obvious that an extremely low bottom gear, steady cornering, and plenty of reserve power for absolutely certain acceleration are the surest way of making a faultless climb.

Unwanted Assistance.



Very few solo men or sidecar drivers failed altogether to get up this nasty hill with its two awkward corners, tough incline, and considerable length, though quite a number received assistance. In this latter respect, it should be mentioned that on the first, and worst, corner no official regulated outside assistance at first, but when about half the competitors had passed, an official arrived, and first asked the failing rider if he wanted help before he was permitted to have it.

Official regulation of this kind is correct, but it should have been the same for all the riders. Also the competitors should be made aware of the regulation beforehand.



Grit appears to be a special trait of many of the competitors. Quite a num-

Two Harleys on the first reach of Porlock, where many spectators were gathered.

A James outfit entering Devonshire (the white post denotes the county boundary—Porlock is in Somerset, and not in Devonshire, as many imagine).

Geo. Brough (8 Brough-Superior sc.) watches W. Julian (7 Harley-Davidson sc.) enjoying better luck on Lynton than he himself experienced.

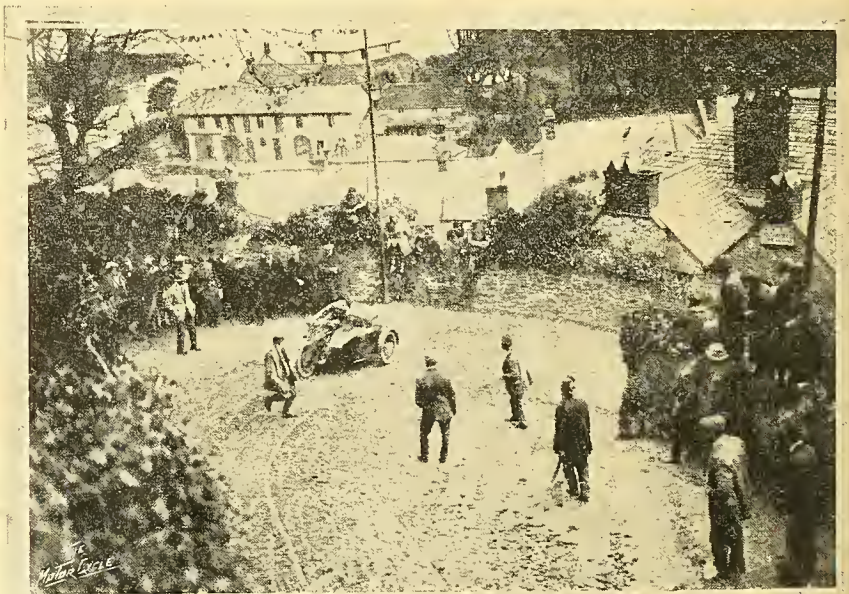
ber came off at the hairpin: at one second hitting the bank, sprawling on the ground with engine roaring, and all the elements of a first-class crash, yet before one had time to get the number on the machine, the rider would be up and on his way again. Before detailing some of the star performances, and the failures, one man especially demands mention, for he would not be beaten; he turned defeat into a victory. This was D. Crawford (5 Zenith), who stopped at the first corner. Nothing much the matter: just general difficulties. Thereafter quietly and at intervals he tried again and again until one lost count. Every time something happened to him; either he just stuck or was baulked. But he would not give in, and at last got away on a clean climb, receiving an ovation that he thoroughly deserved.

Exceptionally good climbs were made by Karslake (8 Brough Superior), Olsson (3½ Sunbeam), Hoult (3¾ Scott), Ellison (6 Zenith), Guthrie (2¾ Dalton), Knight (3½ Norton), Slann (4 Triumph), Applebee (2¼ Levis), Kickham (3½ Douglas), Wall (2¼ Cedos), Bray (3½ Nut), Keevil (3½ Sunbeam), Fellowes (4 Coulson B), Churchill (2¾ Verus), O'Sullivan (4 Harley-Davidson), and Harveyson (4 Indian Scout).

Good Sidecar Performances.

Excellent climbs were also made by Fell-Smith (8 Rex sc.), Le Vack (7 Indian sc.), Simpson (7 Indian sc.), Sandford (6 Rover sc.), White (8 Sunbeam sc.), Packman (8 Matchless sc.), Parsons (8 Matchless sc.), Ellis (8 Matchless sc.), Hardy (8 Matchless sc.), Gibson (8 Royal Ruby sc.), Nott (8 Matchless sc.), Watson (6 Ariel sc.), Lumniss (8 Sunbeam sc.), Brandon (4 Triumph sc.), W. H. Bashall (6 Martinsyde sc.), Masters (7-9 Harley-Davidson sc.), J. T. Bashall (6 Martinsyde sc.), Carslake (7-9 Harley-Davidson sc.), Julian (7-9 Harley-Davidson sc.), G. Brough (8 Brough Superior sc.), Pehrson (4½ Dunelt sc.), Attwood (4 Norton sc.), Guiver (8 Matchless sc.), Newnham (4¼ B.S.A. sc.), Strong (7-9 Harley-Davidson sc.), Hillary (4 Triumph sc.), Claridge (4 Triumph sc.), Charlesworth (8 Zenith sc.), Watson (7-9 Harley-Davidson sc.), Giles (7 A.J.S. sc.), McGowran (4 Triumph sc.), Allen (7-9 Harley-Davidson sc.), Hemy (7 A.J.S. sc.), Hartfall (10 Morgan), Sawtell (10 Morgan), McCarthy (10 Morgan), Holmes (10 Morgan), Bennett (10 Morgan), and Croucher (Coventry Premier).

Elce (10 Morgan) stopped past the first bend and baulked Spouse (10 T.B.).



Across Exmoor from Porlock the track (we use the word advisedly) was of wet clay interspersed with pot-holes filled right up by that untimely shower.

It was only a shower after all, for by the time Lynton was reached by No. 1 it was dry once more—overhead!

This area claimed its quota of tosses—A. C. Rhodes (3½ N.U.T.) took rather a nasty one, but like the others he carried on. The later sidecar and three-wheeler men were more fortunate; less affected by skidsome roads, they were blessed with greatly improved visibility.

In Devonshire

It had rained in Lynton and Lynmouth during the night just sufficiently to con-

A 4¼ h.p. B.S.A. and sidecar rounding the bend on Lynton. Considerable skill is required in negotiating this nasty corner.

A critical moment on Lynton. A. Pehrson (4 Dunelt sc.), baulked by a man in front, was forced to stop, but re-started again without assistance.

vert the dry surface of Lynton Hill into slippery grease much resembling the Derbyshire Peak District oolite. Even by 7.30 a.m. spectators had assembled for the fray, and the checking was done by members of the Bournemouth M.C.C. The leaders all did well, notably Moffatt (Douglas), Olsson (Sunbeam), and Stacey (Verus), but Karslake clearly was anxious on his Brough Superior, which, though possessed of abundant power, was difficult to keep straight in the grease. He stuck gamely to the task, but half-way up came to a standstill.

Here it may be said that the heavy and powerful solo mounts were repeatedly in difficulties on the Devonshire terror, for once the throttles were opened the back wheels could obtain no grip. A Scott, a Norton and an Ariel toured up the 1 in 4½ grade comfortably enough, followed by F. W. Applebee, whose Levis was going great guns. This ever popular veteran received a great ovation from the crowd.

Traces of Porlock!

Clifford Wilson (Quadrant) was conspicuous for a cool climb, but Hoult (Scott) overtook him and just touched his arm in passing on the narrow strip of smooth surface which all the soloists hugged. Sims (Triumph) arrived with red clay smeared over his coat and face; evidently he had fallen, but his engine was in fine fettle.

Prestwich (2¾ New Imperial) went up with a crackle which might have been heard half a mile away; his speed caused him to slide about, but he kept upright. Ellison (Zenith) footed round the hairpin, where most of the fun occurred, and finally stopped. Street (Sunbeam) also footed, but only to keep himself upright.

It was a subject of open comment that many riders failed to handle their machines with any great skill. Many were evidently excited, and went at the hill with open throttles and a "do or die" expression, only to find that their back tyres would not grip, when a less generous throttle would have sufficed.

Leather (N.U.T.) stopped, Plowman (Triumph) footed, and Knight (Norton) was excellent, and, moreover, won the palm for the noisiest exhaust; Notari (Triumph) stopped; Rhodes (N.U.T.) made a good ascent. Then a curious incident occurred. Wallis (8 Reading-Standard) appeared in view round the bend, and as if his "horse" had shied at the gradient, performed a lightning pirouette, and shot straight down the hill. He stuck to his machine magnificently, and prevented what might have been a bad accident.

Then followed a fifteen minute gap; so many clearly were late. A blue trail down Countisbury, across the Lyn Valley, indicated the approach of other competitors, and Slann—a local rider—appeared on a Triumph. Rounding the bend

R. Carey (8 Blackburne sc.) closely following a Morgan on Lynton. Observe the excited spectators in the foreground, who considerately advised many of the passengers to sit on the carrier to avoid wheel slip.

The 1921 London-Land's End Run.—cautiously, he appeared about to peter out, when he let in the low gear and simply toyed with the gradient.

Bateman and Price, on Diamond machines, were both good. Alcock (Coulson B) peeped round the corner, his back wheel shot from under him, and he descended again at speed, to the spectators' great amusement. He did better next time. Francis (Triumph) was good. Morgan, on a similar machine, used his feet. Cuffe (Metro-Tyler) made a steady climb. Bourlet (Ariel) had power to spare. Shepherd (Beaumont) was good.

Roadman's Attention to Lynton.

Another gap, what time a roadman, with a useful spade, removed some of the surface grease. Kickham (3½ Douglas) came next, and made one of the best climbs of the day. Labin (Indian Scout) went up nicely, but trailed his feet. Ammon (Metro-Tyler) stopped, due to lack of petrol, so it was said. Bray (N.U.T.) footed slightly. Wall (Cedos) skidded below the bend, and remounted. Morgan (Harley-Davidson) also skidded on the corner, lying prostrate when Keevil (Sunbeam) appeared, and dexterously avoided him, continuing with a clean ascent.

O'Sullivan (4 Harley-D.) made a very neat climb, but Fellowes (Coulson B) elected to cut the corner, scattering the spectators. It was a good ascent, however. Churchill (Verus) went up well, but noisily, Knill (Indian Scout) footed slightly, Guthrie (2¾ Dalton) went up as cool as a cucumber, but he was observed to use his feet nearer the summit; Eaton (N.U.T.) had his engine running too fast and footed to keep upright. Cunningham's P. and M. was in fine fettle, and ascended surely, also Richardson (Lea-Francis), Harveyson (Indian Scout), and Watson Bourne (Rex). Love (Douglas) made a clean ascent.

The Sidecars Arrive.

Then followed, at 8:57 a.m., the first sidecar—Glendinning (8 Rex). Flinging mud from his driving wheel, he went up magnificently; Le Vack (7 Indian) was next, and stopped due to lack of wheel grip, side by side with Simpson on a similar outfit. There was a perfect din at this stage, for Sykes (Harley-D.) arrived and had to foot to keep straight. Fell Smith (8 Rex) was excellent. Michaelis (7 Harley) and White (Sunbeam) stopped, with wheels spinning.

Now the spectators tumbled to the reason and yelled to the passengers to get on the carrier to assist wheel adhesion. Some could not understand the shouting and gesticulations, and the drivers were often puzzled and consequently hampered.

Stone (Olympic) and Ratcliffe (Brough Superior) had difficulty in avoiding stranded sidecars; the former footed, but the big twin showed up very well. Marvin (Rex) stopped, Ross (Matchless) was very good, but Ellis (Matchless) stopped with his engine running. Sandford (6 Rover sc.) was good. Apsey (Royal Ruby) shed his passenger, and Hardee (Matchless) did the same; then Gibson (Royal Ruby) made probably the finest and fastest climb of the sidecars. Dale on a similar outfit dismounted and ran, Parsons (Matchless) got up after his passenger had climbed on to the touring valise perched high on the carrier, Nott (Matchless) was sure and fast withal, Packman (Matchless) good, Lucking (New Imperial) stopped with his engine asking for weight on the back wheel. Watson (Ariel) nearly stopped until his passenger did a lightning move to the carrier, when he picked up speed, W. E. Brough (Brough) stopped, also Lunniss (Sunbeam) and J. T. Bashall (Martinsyde). W. H. Bashall (Martinsyde) was "touch and go," but just crawled over the summit; Caslake (Harley-Davidson) was good; Masters (Harley-Davidson) was unlucky in being baulked, and stopped in the stones after accounting for the worst pitch; W. Julian (7 Harley-Davidson) charged the inside of the bend, and went up well, passenger and driver bouncing up and down in unison. George Brough came round the bend at speed, when his engine suddenly pëtered out for no apparent reason. Restarting, he went up comfortably. Kaye Don (6 Zenith) just scraped the wall, but got up well. Pehrson (Dunelt) was baulked, waved assistance aside, and then restarted with ease, and went up splendidly.

S. Julian (Humber) slewed across the road, and had to halt momentarily, though his engine kept running. Strong (Harley-Davidson) was baulked; Claridge (4 Triumph sc.) made a very good, steady climb; Charlesworth (8 Zenith) was excellent, in spite of switching off to avoid the inevitable stray dog; Allen (Harley-Davidson) did well; Giles (7 A.J.S.) made a conspicuously good climb; and McGowran (4 Triumph sc.) made some of the big twins look sorry by his sure and clean ascent. Tait (Harley-Davidson) got well past the corner before he came to a standstill; Saddington (6 James) was excellent.

We sympathise with some of the charming lady passengers, who, in the excitement of the moment, were energetically coaxed out of their snug sidecars on to the carriers to assist in holding the back wheel down. The display of dainty ankles was quite a feature of the morning's ascents.

Runabouts do Well.

Spouse (T.B.) led the runabouts, and did well, thanks to Parsons chains. Hartfall (Morgan) was, if anything, faster. Carey (Blackburne sc.) made a good climb, also Hillary (Triumph sc.). Sawtell (Morgan) went up well, also Croucher (Coventry Premier) and McCarthy (Morgan). Betteridge (Douglas sc.) was late, and broke his belt. Of the light four-wheelers there was no more meritorious climb than that of V. G. Loyd (6 Carden); the two-stroke twin engine had a most healthy crackle. G.N. drivers also merit special mention.

Lynton overcome, some thought their troubles over, but those who had been before knew better. For, beyond Bideford and almost right into Holsworthy, the road was vile. Single file was the order for the survivors. So many were unseated that it would be invidious to particularise; and, as a result, a secret check near Holsworthy found very few early, not a few too late for a "gold," and one or two unfortunates who had forfeited all hope of a humbler "silver."

The welcome lunch stop at Launceston revealed many bent footrests and lamps.

At noon the leading men were off again fortified by promises (fulfilled) of better roads now that Cornwall had been reached. Indeed, the going to Bodmin and across Goss.noor to Truro was so good that another secret check formed an unpleasant reminder of the 20 m.p.h. schedule.

From Penzance to Land's End the twisting, "lumpy" road was thoroughly hated by all, and returning competitors made it even worse for the "tail-enders."

LONDON-LAND'S END SURVIVORS: 148 motor cyclists started; 108 finished.

MOTOR BICYCLES.

1. T. S. Sharratt (4 Indian Scout).
2. F. A. Longman (3½ Ariel).
3. P. W. Moffat (3½ Douglas).
4. E. A. Wright (2¾ Diamond).

133. G. K. Gibbs (8 Reading Standard).
134. B. S. Allen (7 H.-Davidson).
135. F. W. Giles (7 A.J.S.).
137. S. C. Tait (7 H.-Davidson).
138. A. P. McGowrau (4 Triumph).
139. W. C. Hemy (7 A.J.S.).
141. V. Pentlow (4¼ B.S.A.).
142. R. Carey (8 Blackburne).
143. H. H. Saddington (6 James).

THREE-WHEELED CYCLE CARS.

145. A. E. Hartfall (10 Morgan).
146. F. S. Spouse (10 T.B.).
148. R. Croucher (7 Cov. Premier).
151. S. A. McCarthy (10 Morgan).
152. H. W. Holmes (10 Morgan).

The gaps in the numbers indicate retirements, excepting the following non-starters: 8, 18, 36, 61, 64, 65, 118, 121, 131, and 150.

The EASTER INTER-CLUB MEET at RICHMOND

Record Attendance at Northern Gathering of Motor Cyclists on Good Friday. Eleven Hundred Machines Assembled.

ON Good Friday the Mayor and Corporation of the ancient borough of Richmond in Swaledale welcomed motor cycle clubmen to their town for the third year since the war.

In 1919 a scarcity of men made the meet a mere gathering of a handful; in 1920 the scarcity of motor cycles resulted in the rallying of fewer than 300 machines; but this year proved a record. By mid-day on Good Friday over 800 machines were actually counted in the competition for the A.C.U. Cup offered to the club with the greatest percentage of paid-up members present, taking mileage into account. In addition to these, the cobbled market square of the sixteenth century town contained another 300 machines driven by unattached riders, who made Richmond a rendezvous in order to inspect the many machines parked there.

Unpropitious Weather Conditions.

Glorious spring weather, a gorgeous sunset and a wonderful moonrise the previous evening had raised high hopes in the North for a fine Eastertide, but Good Friday arrived to grey skies. Between ten and eleven an unpleasant drizzle of fine rain fell continuously, and the conditions were a little disheartening. Parties, however, were heading for the capital of Swaledale from all points of the compass, and the old market square, very type of that "old-fashioned town" of song fame, which was wrapped in its habitual calm at ten o'clock, was filling rapidly by eleven. At noon the spacious cobbled places around the square-towered church were filled almost to overflowing, for strong representations

All types of motor cycles being marshalled by police and scouts into the town.

The Richmond Meet.—

from thirty-three motor cycle clubs were present, and every type of machine from the miniature to the light car was to be seen.

The marshalling of the riders on arrival was efficiently carried out, each being directed to the section indicated for his club by a banner marked with the appropriate name and colours.

Nominally, the taking of the count was due at twelve noon, but a delay took place as a result of a somewhat prolonged meeting of the committee and judges in order to discuss the question of the mileage travelled by competing clubs to the rendezvous on the day previous to the actual meet. Amongst the local clubs it is understood that the distance covered in attending the meet shall be accomplished actually on Good Friday, but this not being in the printed rules a team from the North London M.C.C. made an entry and thirteen arrived. It was at first decided that their Friday mileage should be counted, but ultimately their total mileage was taken.

While the count was proceeding many Thermos flasks and Primus stoves were in evidence, for the influx of some fifteen hundred visitors naturally strained the catering resources of the town to the utmost.

Awards for Ingenious Fitments.

Other judges were examining the machines for the allocation of such awards as those for the best kept machines and the most ingenious device fitted by a rider; and about three o'clock the results were announced in the Town Hall.

Unfortunately, some of the clubs had already departed, and, in consequence, the names of certain prizewinners could not be announced, only the registration numbers of their machines being available. Amongst the assembled motor cycles, few outstandingly new or original home-made "gadgets" were to be seen, while the condition of the machines generally was that they were either nearly new or had the appearance of having seen considerable service, and in many cases were indifferently kept.

Including those of non-competing visitors, some eleven hundred machines were parked in the market place at Richmond (Yorks).

The principal award, the A.C.U. Trophy, for competition amongst motor cycle clubs, decided on the formula: Percentage of paid-up members present multiplied by mileage travelled, fell to the Scarborough and District M.C.C., and the placing was as follows:

	No. present.	Fig. of merit.
Scarborough	33	5356
Leeds M.U.	51	5100
Doncaster	19	5007
Barnsley	39	4986
Hull Auto.	21	3465
North London	13	3234
Barrow	23	2901
York	47	2801
Colne	20	2727
Wakefield	25	2607
Keighley	24	2089
Middlesbrough	66	1957
Annfield Plain	20	1872
Durham	34	1647
Easingwold	17	1575
Sunderland	23	1483
Harrogate	42	1460
Ilkley	34	1389
Wombwell	11	1357
Beverley	1	1321
Leeds and Dis.	29	1198
Bradford	32	1138
Northern (Newcastle)	26	985
Bradford (Gypsies)	24	916
Hartlepool	11	836
Newcastle	28	714
Sheffield and Hallam	7	548
Ripon	16	535
Blackpool	2	340
Bishop Auckland	5	268
Darlington	25	—
Hull M.C.C.	14	—
Skipton	24	—

Other results were:

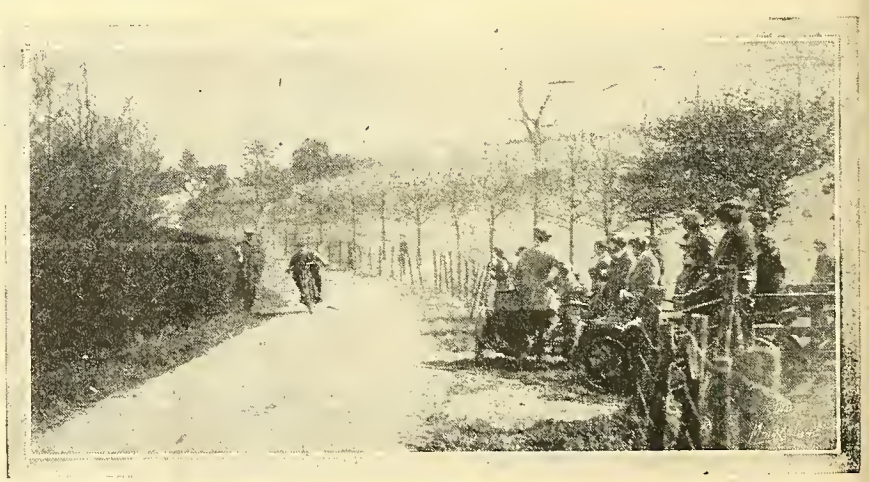
Mayor of Richmond's prize for owner of best kept machine: G. Dawson (3½ Rudge, 1916 model), Bishop Auckland M.C.C.

Prize for best kept ladies' machine: Mrs. Gilchrist (6 A.J.S. sc.), Middlesbrough M.C.C.

Prize for lady driving greatest distance to attend: Miss Ireland (Scott sc.), Barrow M.C.C.

The Motor Cycle prize for the most ingenious amateur improvement: C. Cockran (8 Clyno sc.), Ripon M.C.C., partioned tool drawer in luggage grid.

GOOD WEATHER FAVOURS SOUTHERN HILL-CLIMB.



AN inter-club hill-climb was held on Good Friday between the West Kent Motor Club and the Holmwood M.C.C. The meet was at Green Street Green, whence competitors proceeded to the venue, in the neighbourhood of Shoreham. Over a hundred members of the two clubs witnessed the event, which was run off in magnificent weather.

Results:

350 c.c. CLASS.—1, Jessop (2¾ New Imperial), W.K.M.C., 33⅘s.; 2, Grey (2¾ Douglas), Holmwood M.C.C., 34⅘s.; 3, G. Williams (2¾ Douglas), W.K.M.C., 35s.

600 c.c. CLASS.—1, A. G. Williams (3½ Norton), W.K.M.C., 27⅗s.; 2, Farman (4 Matchless), 29⅗s., and Wallis (A.B.C.), W.K.M.C., 29⅗s.; 3, Bull (4 Bradbury), W.K.M.C., 30⅗s.

UNLIMITED CLASS.—1, L. Williams (6 Zenith), W.K.M.C., 26s.; 2, Hyde (Harley-Davidson), W.K.M.C., 26⅗s.; 3, Tweedy (Harley-Davidson), W.K.M.C., 29⅗s.

A competitor in the Kent club's hill-climb making a flying start.

AN EASTER "ROUND-UP."

In Gloucestershire and Somersetshire there was much activity on the part of the police during the week-end examining licences.

OTHER EASTERTIDE EVENTS.

Dr. Lindsay rounding the top bend in the Carmarthen M.C.C. hill-climb.

Hill-climb in South Wales.

THE hill-climbing and speed trials under the auspices of the Carmarthen and District M.C. and C.C. on Good Friday attracted eighty-six competitors, and the whole course was lined with interested spectators. The test selected was the Golden Grove Hill, situated about eighteen miles outside Carmarthen and in sight of the Earl of Cawdor's magnificent Carmarthenshire residence. Conditions were ideal, no sun to interfere with the competitors, and the road surface dry, hard, and clean. At the tail of a particularly difficult S bend a little "grease" on the outside of the bend took heavy toll. Several of those who swept the corner rather wide came to sudden grief. Undoubtedly the mounts which manœuvred the bends best, although not figuring in the awards list, were the Scotts. The total length of the course was practically one mile. The winners were :

CLASS 1 (250 c.c.).—Expert: 1, J. Thomas (Massey-Arran), 1 min. 35½ sec. General: 1, B. Griffiths (New Hudson), 1 min. 44 sec.

CLASS 2 (300 c.c.).—Expert: 1, J. Thomas (Massey-Arran), 1 min. 33⅘ sec. General: 1, J. J. Davies (Omega), 1 min. 55⅘ sec.

CLASS 3 (350 c.c.).—Expert: 1, Wm. Edwards (Massey-Arran), 1 min. 26⅘ sec. General: 1, E. O. Evans (Douglas), 1 min. 26 sec.

CLASS 4 (500 c.c.).—Expert: 1, Dr. Lindsay (Norton), 58 secs.; 2, H. Davies (A.B.C.), 58⅘ sec. General: 1, M. Price (Norton), 1 min. 4 sec.; 2, J. Evans (Rover), 1 min. 6 sec.

CLASS 5 (Unlimited c.c.).—Expert: 1, H. Davies (A.B.C.), 1 min. 1½ sec.; 2, J. Ash (Norton), 1 min. 2⅘ sec. General: 1, J. Ash (Norton), 1 min. 2⅘ sec.; 2, J. L. Jenkins (Norton), 1 min. 5⅘ sec.

CLASS 6 (Sidecars, unlimited).—Expert: 1, J. Ash (Norton), 1 min. 15 sec.; 2, Alex. Thom (Harley-Davidson), 1 min. 17⅘ sec. General: 1, B. Griffiths (James), 1 min. 23⅘ sec.; 2, T. Hancock (Enfield), 1 min. 33 sec.

Fastest time of the day, 58 secs., Dr. Lindsay (Norton).

Westmorland Open Hill-climb.

THE open hill-climb organised by the Westmorland M.C.C. for Easter Monday had to be abandoned at the eleventh hour owing to heavy rains and high winds. A vote was taken of the assembled competitors, who decided that the event should be postponed.

A North-Western Easter Rally.

ONE hundred and fifty members of twelve clubs affiliated to the North-Western Centre A.C.U. faced heavy snow and rain for the inter-club rally at Ribchester on March 27th. Fortunately, however, the weather cleared up at lunch time, and the judges were able to make their inspection for awards, which are as follows :

THE MOTOR AGENTS' CUP for largest number of points gained by a club (percentage of members present multiplied by mileage from headquarters).—1, Liverpool M.C., 817 points; 2, Blackpool M.C.C., 763 points; 3, Burnley M.C.C., 720 points.

SMARTEST SOLO MACHINE.—Porter, Accrington (2¾ Douglas).

SMARTEST SIDECAR.—Parker, Liverpool (8 Matchless).

OLDEST MACHINE PRESENT.—Fox, Liverpool (1912 Matchless).

LADY RIDING THE GREATEST DISTANCE.—Miss Cottle, Liverpool (79 miles).

LADY'S MOST SUITABLE COSTUME.—Miss Cowley, Manchester.

GENTLEMAN'S MOST SUITABLE COSTUME.—Mercer, Colne.

OLDEST RIDER AT THE RALLY.—Willock, Accrington (52 years).

YOUNGEST RIDER.—F. Hebden, Burnley (14 years 4 days).

A Birmingham to Lynmouth Trial.

ARRIVING at Lynmouth just after the last of the M.C.C. competitors had gone on, members of the South Birmingham M.C.C. held a fast and slow climb on the new road to Lynton at the conclusion of their trial from Birmingham. The event also included the ascent of Porlock, where H. Johnson (2¾ Allon sc.) made a clean climb, after averaging 20 m.p.h. for the run.

The following had clean sheets on arrival at Lynmouth :

B. Kershaw (Verus sc.), W. Handley (2⅘ O.K.), L. Newey (6 Ariel sc.), L. E. Clulee (2¾ Allon), H. Baragwanath (3½ Sports Sunbeam), and H. P. Cutler (4 Norton sc.).

The flexibility test resulted as follows :

SOLO CLASS.—1, H. Baragwanath (3½ Sports Sunbeam); 2, L. E. Clulee (2⅘ Allon).

SIDECAR CLASS.—1, L. Newey (6 Ariel sc.); 2, H. P. Cutler (4 Norton sc.).

Rain fell throughout the return trip.

Easter Monday Hill-climb at Staxton.

SLIGHT showers and high wind proved no detriment to the 170 entries for Staxton hill-climb, the popular Easter event of the Scarborough M.C.C. There were ten classes, and the results were as follow :

CLASS I. (275 c.c.).—1, J. S. Jenkins (2¼ Velocette), 1m. 14s.; Miss S. F. Wilson (2¼ Velocette), 1m. 52⅘s.

CLASS II. (350 c.c.).—1, J. S. Jenkins (2¼ Velocette), 1m. 16⅘s.; 2, J. T. Johborn (2¾ Sunbeam), 1m. 23⅘s.

CLASS III. (600 c.c. Sidecars).—1, E. Searle (3½ Norton sc.), 1m. 19⅘s.; 2, G. Hill (3¾ Scott sc.), 1m. 49⅘s.

CLASS IV. (800 c.c. Sidecars).—1, E. Searle (3½ Norton sc.), 1m. 17⅘s.; 2, W. Wells (4 Norton sc.), 1m. 40s.

CLASS V. (1,100 c.c. Sidecars).—1, E. Earle (3½ Norton sc.), 1m. 20⅘s.; 2, W. Wells (4 Norton sc.), 1m. 40⅘s.

CLASS VI. (560 c.c. Sidecars).—1, R. T. Cawthorne (3½ Norton sc.), 1m. 2s.; 2, E. Searle (3½ Norton sc.), 1m. 2⅘s.; 3, H. G. Sissons (3½ Norton sc.) and L. A. Runton (3 A.B.C. sc.) tied.

CLASS VII. (Unlimited Solo).—1, E. Searle (3½ Norton), 1m 0⅘s. (fastest time of day and record for the hill); 2, A. C. Thornton (3½ Norton), 1m. 5s.; 3, F. Shepherd (3½ Sunbeam), 1m. 5⅘s.

CLASS VIII. (650 c.c. Touring Solo).—1, W. Backhouse (4 Triumph), 1m. 8⅘s.; 2, L. A. Chappel (4 Triumph), 1m. 12⅘s.

CLASS IX. (1,100 c.c. Touring Solo).—1, A. C. Thornton (6-7 Ariel), 1m. 8⅘s.; 2, L. A. Chappel (4 Triumph), 1m. 12⅘s.

CLASS X. (Cycle Cars).—1, F. W. James (10 Morgan), 1m. 27s.; 2, R. E. H. Hatton (10 G.N.), 1m. 50s.

Everything went off to time, the arrangements being excellent. Miss F. Rippon (4 Triumph), won the special prize for the best performance of the day by a lady.

Easter in Ireland.

IN spite of the severe restrictions prevailing in Ireland where motoring is concerned, the Dublin M.C.C. ran off a successful trial on Easter Monday. Owing to the nature of the course and severe weather conditions, only eight finished. These were as follows : P. H. Hurse (B.S.A.), N. Leppler (Indian), J. A. Carville (Triumph), T. E. Green (Enfield), G. Thompson (Matchless), — Nesbitt (Douglas), J. Mactaggart (Indian), and A. Carton (Indian).

North, South, East, and West.

ALL the important motor cycle events held at Eastertide are described in this issue of *The Motor Cycle*. The articles are accompanied by exclusive photographs by our own operators. Four pages are devoted to the classic London-Land's End Trial. This year the Richmond (Yorkshire) Meet attracted a record crowd of nearly 1,100 motor cyclists.

Just as our last issue formed a programme of Easter events, so this issue records the latest available news of trials from all parts of the country.

A Stormy Week-end Event.

HEAVY rain showers, some sleet, and muddy roads spoiled the first day's run of the Glasgow Western M.C.C. Easter trial. Saturday's course was over a very easy route, being the main road to Carlisle. Monday's route, however, was of a more strenuous nature, and embraced several hills well-known to English competitors, such as Buttermere Hause, Red Bank, and Kirkstone.

Out of an entry of forty-four about forty started. The first check, at Abington, found the majority arrive to time. H. M. Batten (3½ P. and M.) arrived with a tube round his waist, appearing to have had puncture trouble; while Gordon Baker (8 Acme sc.) wasted precious minutes during a wayside halt. Several machines were making their first appearance in Scottish local events, these being the Scott Squirrel, ridden by A. J. C. Lindsay, and the flat twin Humber ridden by T. Watson. A.J.S. sidecars were well to the fore, and interest centred in the performance of Mrs. Bell, who was driving one of these outfits through the event.

Speed Trials in Lincolnshire.

ON Easter Monday, the East Midland Centre A.C.U. held speed trials at Grimsthorpe Park, Bourne, Lincolnshire. With twenty classes, well supported, the programme was a long one. A strong following wind prevailed, but the weather, though threatening, did not prevent the programme being brought to a successful conclusion. The distance was half a mile. F. T. Bidlake was the official timekeeper.

CLASS 16 (Open, Solo, 350 c.c.).—Flying start: 1, G. Dance (2¼ Sunheam), 19⅗s.; 2, A. Swann (2¾ New Imperial), 25⅗s.

CLASS 17 (Open, Solo, 500 c.c.).—Flying start: 1, G. Dance (3½ Sunbeam), 18⅗s.; 2, H. Petty (3½ Norton), 20⅗s.

CLASS 18 (Open, Solo, 550 c.c.).—Flying start: 1, G. W. Walker (3½ Norton), 19⅗s.; 2, H. Petty (3½ Norton), 20⅗s.

CLASS 19 (Open, Solo, 750 c.c.).—Flying start: 1, G. Dance (3½ Sunbeam), 18⅗s.; 2, H. Petty (3½ Norton), 20⅗s.

CLASS 20 (Open, Solo, Unlimited), Flying Start.—1, G. Dance (3½ Sunbeam), 18⅗s.

CLASS 2 (Open, Sidecars, 550 c.c.), Standing Start.—1, G. Dance (3½ Sunbeam sc.), 30⅗s.; 2, H. Petty (3½ Norton sc.), 34⅗s.

CLASS 3 (Open, Sidecars, 750 c.c.), Standing Start.—1, G. W. Walker (3½ Norton sc.), 31⅗s.; 2, G. C. Boston 2¾ A.J.S. sc.), 31⅗s.

CLASS 4 (Open, Sidecars, Unlimited).—Standing start: 1, G. Dance (3½ Sunbeam sc.), 29⅗s.; 2, Reg. Stacey (7-9 Harley-Davidson sc.), 30s.

CLASS 6 (Open, Sidecars, 550 c.c.).—Flying start: 1, G. Dance (3½ Sunbeam sc.), 22s.; 2, H. Petty (3½ Norton sc.), 24⅗s.

CLASS 7 (Open, Sidecars, 750 c.c.).—Flying start: 1, V. Horsman (3½ Norton sc.), 24⅗s.; 2, H. Petty (3½ Norton sc.), 24⅗s.

CLASS 8 (Open Sidecars Unlimited)—Flying Start: 1, G. Dance (3½ Sunbeam sc.), 21⅗s.; 2, Reg. Stacey (7-9 Harley-Davidson sc.), 23⅗s.

CLASS 9 (Open Solo 275 c.c.).—Standing Start: 1, J. V. Prestwich (2¼ Diamond-Jap), 30s.

An A.J.S. sidecar on Kirkfield Bank during the Glasgow Western M.C.C. Easter Trial.

CLASS 10 (Open Solo 350 c.c.).—Standing Start: 1, A. Swann (2¾ New Imperial), 35s.

CLASS 11 (Open Solo 500 c.c.).—Standing Start: 1, G. Dance (3½ Sunbeam), 27s.; 2, H. Petty (3½ Norton), 30⅗s.

CLASS 12 (Open Solo, 550 c.c.).—Standing start: 1, G. W. Walker (3½ Norton), 27⅗; 2, H. Petty (3½ Norton), 28⅗s.

CLASS 13 (Open Solo, 750 c.c.).—Standing Start: 1, G Dance (3½ Sunbeam), 26⅗s.; 2, H. Petty (3½ Norton), 29⅗s.

CLASS 14 (Open Solo, Unlimited).—Standing start: 1, Reg. Stacey (7-9 Harley-Davidson), 29⅗s.

CLASS 15 (Open Solo, 275 c.c.)—Flying start: 1, J. V. Prestwich (¼ Diamond-Jap), 24⅗s.; 2, Mrs. Jennison (2¼ Velocette), 25⅗s.

Victory Cup Trial Results.

VICTORY Cup results have been announced by the Birmingham M.C.C., and are as follow:

Victory Cup for best performance: B. Kershaw (2¾ Verus). Midland Cup for best performance by a passenger machine: R. Brown (3½ Sunbeam sc.). Duke Cup for best performance by a solo machine over 275 c.c.: B. Kershaw (2¾ Verus). Best amateur performance: R. Brown (3½ Sunbeam sc.). Best lightweight under 275 c.c.: P. Pike (2¼ Levis). Team prize: M.C. and A.C. Team No. 2: W. T. Woodcock (3½ Ariel), N. Hall (2½ O.K.), and A. E. Rollason (3½ Ariel).

GOLD MEDALS.—G. S. Arter (5-6 James sc.), W. R. Urwin (2½ Levis), A. Woodfield (4¼ James sc.), H. C. Jennens (3½ James), Reg. Brown (3½ Sunbeam sc.), R. W. Duke (4 Triumph), S. T. Tessier (8 Bat sc.), T. F. Watson (4 Norton sc.), B. Kershaw (2¾ Verus), F. J. Adam (3½ Norton sc.), F. S. Short (5-6 James sc.), H. Newey (2¼ Levis), Hugh Gibson (8 Royal Ruby sc.), J. W. Parkes (2½ Sun-V.T.S.), F. A. Watson (3½ Sunbeam sc.), T. F. Blumfield (6 Ariel sc.), S. E. Longman (7-9 Harley-Davidson sc.), R. T. Cooke (4 Triumph sc.), J. C. Edkins (2¾ Pax), C. W. Ramstedt (2½ Cotton), A. D. Atkin (5 Rover sc.), N. Rycroft 4 Triumph), P. Pike (2¼ Levis), J. E. J. Whitaker (4¼ B.S.A.), L. Baker (8 Enfield sc.), J. W. Wills (3¾ Scott), R. C. Bennet (2¾ Federation), W. F. Smith (2¾ Hobart), S. G. Neal (3 Neal-Dalm), C. H. Hanwell (2¼ Cedos), T. Peck (4½ Ariel sc.), F. H. Brown (8 Rex sc.), H. J. Willis (3½ Norton), A. E. Rollason (3½ Ariel), Eric Williams (3½ Sunbeam), B. Bladder (8 New Imperial sc.), F. S. Barnes (3½ Sunbeam), A. Elliot (5-6 Rover sc.), E. Griffiths (3½ Norton), B. Clare (3½ Norton), J. H. Walker (4¼ B.S.A.), J. W. Moxon (4 Coventry Eagle), W. Chapman (7 A.J.S. sc.), F. A. Longman (3½ Ariel), S. H. Rhodes (2¾ Wolf-Blackburne), W. T. Woodcock (3½ Ariel), W. Handley (2½ O.K. Junior), N. Heather (6 B.S.A. sc.), A. J. Wilkes (3½ Rover), H. Poole (6 A.J.S. sc.), C. L. Hull (2¼ Levis), S. Hall (3½ Sunbeam), L. E. Clulee (2½ Alldays Allon), F. Goodman (7-9 Indian), V. G. Wilkins (2½ New Imperial), W. Brandish (5-6 Rover), H. Riddle (4¼ B.S.A. sc.), G. Denley (2¼ Velocette sc.), J. W. Meredith (10 T.B.), and A. Frazer Nash (8.7 G.N.).

The judges report that J. G. Skinner (2½ Autoglider) completed the course of 128 miles, arriving at all time checks to the schedule time.

The 500 Miles Race.

IT has now been decided by the British Motor Cycle Racing Club that the 500 miles motor cycle race for the Miller 200 Guineas Gold Cup, which is to be held on Brooklands track on Saturday, July 2nd, shall commence at 7 a.m. The race has a time limit of twelve hours; but as the present 500 miles record is held by a 2¾ h.p. machine in a much shorter time, it is anticipated that the winner and a number of others will have completed the distance well before 7 p.m.

Cycle Cars at Brooklands.

BOTH the G.N. and the Crouch cycle cars did well at the Brooklands Easter Monday meeting. The former, driven by L. A. Cushman, proved an easy winner in the cycle car handicap at 63¾ m.p.h., and J. Cocker—better known to motor cyclists as a pre-war rider of Singer and Triumph motor cycles—won two races on his racing Crouch, averaging 69.57 m.p.h. in one event.

NEW SCALE

"THE MACHINE FOR THE DISCERNING RIDER."

UNPRECEDENTED PRICE REDUCTION

COMPARE THESE PRICES FOR VALUE:

4 h.p. NEW SCALE-Blackburne (Sturmey-Archer 3-speed, Clutch, and Kick-starter)	(Solo)	..	£100
	(Combination)	..	£133
2¾ h.p. NEW SCALE-Blackburne (2-speed Gear and Clutch)	Sport Model	..	£87
3½ h.p. NEW SCALE-Precision 2-stroke (Sturmey-Archer 2-speed, Clutch, and Kick-starter)	(Solo)	..	£80
	(Combination)	..	£108

The above reduction does not mean a falling-off in the quality and finish so well known in **NEW SCALE** motor cycles. On the contrary we have improved our machines in detail, and the finish is now on a par with the models shown at Olympia. Nor is this reduction a temporary one, inasmuch as these prices will be maintained throughout the present season. This reduction has been made possible owing to the concentration into our own works of the manufacture of all possible parts, increased efficiency in production, and certain decreases in the prices of raw material

PLACE YOUR ORDER NOW AND AVOID DISAPPOINTMENT.

Less Weight—Greater Strength

THE Dunhill Triangular-frame Chassis is correct in theory and proved in practice. It combines maximum strength and rigidity with minimum weight. We are the original patentees of this design (No. 4784/15) and manufacture the Chassis throughout entirely in our own workshops. Best quality materials only are used and skilled workmen under expert supervision employed.

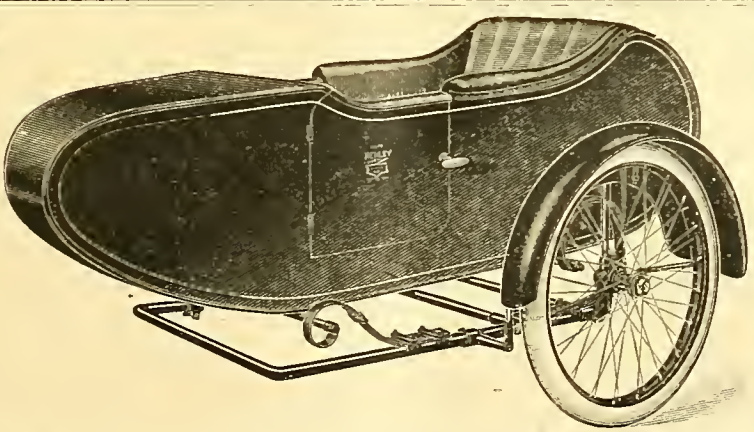
STABILITY in PRICES of J.E.S. machines ASSURED

Many orders are being withheld as reduction in prices is expected, we therefore wish to make matters quite clear regarding the famous little J.E.S. machines

We have very carefully measured production cost, and have also anticipated further slight reductions in cost of material and have fixed our prices so low, that it will not be possible to reduce them *during this season.*



Now should the unexpected happen, and we are able to reduce before Oct. 1st, 1921, we will refund on all machines purchased within 6 months of date of reduction, 25 per cent. of the difference between the price paid, and the new price; on machines purchased within 4 months, 50 per cent.; on machines purchased within 2 months, 75 per cent.; and on machines purchased within one month the full difference.

SPECIAL OFFER
OF
120
2¾ H.P. TWO-SPEED
DOUGLAS
MOTOR CYCLES
at **£55** each.

Fully renovated and overhauled machines at above exceptional price, in order to reduce our —— tremendous stock. ——

THE ENGINE is the famous 2¾ h.p. twin-cylinder "DOUGLAS," overhauled and fitted with many new parts.

GEAR BOX is two speeds, with free position, also overhauled.

CARBURETTER is the two lever AMAC, handle-bar controls.

MAGNETO is new C.A.V., or Thomson-Bennett, with handle-bar control.

THE FRAME, FORKS, MUDGUARDS, etc., are newly stoved in black enamel.

THE TANK is thoroughly renovated, and finished in "DOUGLAS" colours, aluminium and blue panels with "DOUGLAS" transfer.

THE WHEELS are newly stove enamelled and fitted with 26" x 2¼" tyres, either new or good serviceable second-hand.

HANDLE-BARS, semi T.T. newly nickel-plated, as also are other usual plated parts.

The whole finish is quite good, and each machine is tuned up and tested before delivery, and is guaranteed to be in sound serviceable condition. Each machine is equipped with new tool bag, tool kit and pump.

These machines are fully equal to those advertised by other firms at £65 each.

Cash Price **£55** each,
or fully equipped with Lamps and Horn, £58 each.

Carriage extra. Deferred payment arranged.

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

Don't Scrap an old Engine,

but give it a

NEW LEASE OF LIFE

by fitting the

World-famed Philipson Pulley.

Entirely Free from troublesome and weighty complications—only two working parts—no levers, rods, wheels, etc., to worry about. Simply takes the place of the ordinary pulley. One nut secures the complete gear to the engine. Can be fitted without any alterations to most direct belt-driven engines in a few minutes.

For hill-climbing it is unsurpassed. Makes mountaineering easy.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet.

During the past few weeks the following machines have been fitted with PHILIPSON Pulley:

Triumph,	**Arno,**
Rover,	**Rex,**
Norton,	**B.S.A.,**

"COWEY" 1920 pattern MECHANICAL HORNS.

Makers' price, 60/-

Our Price: **29/6** Each. Postage 1/-

GENERATORS (Motor Cycle).

Small, **5/6** each.
Medium, **8/6** and **11/6** each.
Large, **14/6** and **25/-** each.
Postage 9d.

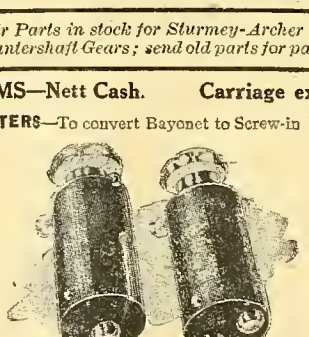
SILENCERS (Aluminium).

For SINGLES. (With short tube.)
13/6 each. Postage 1/-

For TWINS. (With long tube.)
15/6 each. Postage 1/-

SIDECAR CARRIERS

(To bolt on to the Body).
15/6 each. Postage 1/3.



TOOLBAGS (Armoured)

Complete with Clip.
Size, 7⅜in. x 3¾in. x 3¾in.
6/- ea. Postage 9d., or 11/9 pr. Postage 1/-

Repair Parts in stock for Sturmey-Archer Hub or Countershaft Gears; send old parts for pat'ern

TERMS—Nett Cash. Carriage extra.

ADAPTERS—To convert Bayonet to Screw-in Bulb.

Single or Double Pole, 2/- each, post free.

TURNER'S STORES,

SIDECAR ATTACHMENTS.

S

FOR

SANDUM, the Smart Sidecar Specialists.

SANDUM Sidecars.—Best value in Olympia Show

SANDUM Models.—The Exquisite £24/10, and Sports £28/10, are of distinctive appearance.

SANDUM Elite Sidecar, £28/10; the smartest sidecar on the road; highly recommended in "The Motor Cycle."

SANDUM Duel Purpose Sidecar (patented). A single or 2-seater sidecar as required in 5 seconds. Size of body as our single-seater Elite. Luxuriously comfortable seating for 2 adults, with the weight in correct position over rear axle. Finished in colours to suit any make of machine, £45; bodies only, £22/10. The latest development of the 2-seater as designed by us, and approved by the recognised experts.

SANDUM Featherweight Streamline Body, smart and racy, weight 18 lbs.; price £4/17/6.

SANDHAM Engineering Co., Ltd., 336, Gray's Inn Rd., W.C.1. 'Phone: Museum 3427. Factories: 162 to 165, Pentonville Rd., N.; and Britannia Works, Britannia St., W.C. [001

ALLEN-BENNETT Motor Co., Ltd.

SWAN Sports, all models, from £30; fittings for all makes, including Henderson, Indian, Triumph, Douglas, Harley, etc. Some special shop-soiled bargains.

HENDERSON, all models, also some special shop-soiled bargains.

MILLFORD, all models, also some special shop-soiled bargains.

BAICO, Indian, bulbous back, list £45, our price £38; Triumph fittings, £28.

MILLFORD, all models.

THE Albeu, bulbous back, any colour, any fitting, from £25.—9, 10, 11, Royal Parade, West Croydon. 'Phone: Croydon 2450. [629

MIDDLETON'S Spring Wheel Sidecars are guaranteed for 3 years.

MIDDLETON'S One Piece Unbreakable Chassis Axle, with spring wheel, is fitted to our 2-seater and sidecars for high powered machines.

MIDDLETON'S Undertake all classes of repairs to motor cycles and sidecars, bodywork, etc.

MIDDLETON'S, London's Oldest Established Sidecar Makers, Wholesale and Retail, 27, Stroud Green Rd., Finsbury Park, N.4 'Phone: Hornsey 1584. [052

SIDECAR Chassis; £5, or near offer.—Acfold Rd., Fulham, S.W. [841

SIDECAR, coachbuilt; £5/10.—1, Springfield Park Crescent, Catford, S.E.6. [851

SIDECAR, 28in. wheel, new sporting body; £15.—Archer, King's St., Hammersmith. [876

P. and M. and Douglas Sidecars; £10 each; good condition.—24, Church Walk, Hampstead. [883

BARGAINS.—Shop-soiled high-class coachbuilt sidecars, cheap.—Booth's Motories, Halifax.

BARGAINS.—Shop-soiled underslung sidecar chassis cheap.—Booth's Motories, Portland Place, Halifax.

BARGAINS.—High-class coachbuilt bodies, any colour.—Booth's Motories, Portland Place, Halifax.

BARGAINS.—Shop-soiled £27/10 sidecar, suit Triumph or B.S.A.; £18/15.—Booth's Motories, Halifax.

BARGAINS.—Nearly new Henderson sidecar, suit Rudge, £16/15; Millford 27 gn. sidecar, nearly new, £16/10.—Booth's Motories, Halifax. [785

BASTONE'S for Sidecars and Bodies; no better or cheaper house. Kindly inspect our models before purchasing elsewhere.

BASTONE'S.—New 1921 sporting and other models in stock. Bodies from £4/10; complete sidecars from £16/10.

BASTONE'S.—We have a few soiled sidecars and bodies to clear at low prices.

BASTONE'S.—Distributing agents for the famous Montgomery sidecars. Latest 1921 sporting and other models in stock; trade supplied.

BASTONE'S (Sidecar Dept.), 228, Pentonville Rd., King's Cross, London, N.1. Tel.: 2481 North. [553

WATSONIAN Coachbuilt Sidecar; £12. — 11, Kramer Mews, West Brompton, S.W.6. [847

SIDECAR, Mills-Fulford, C.B., off B.S.A.; £15.—Walters, 61, Westow Hill, Upper Norwood. [60

SIDECAR, Mills-Fulford C.B., good condition; £1 after 6 p.m.—40, Derwentwater Rd., Acton. [852

EMPIRE Sidecar, good as new, cost £35; fit any machine; £24.—West, Popeswood, Binfield. [59

SCOTT. W.D., sidecar; also set Chater-Lea sidecar clips, complete, £4.—Tijou, Loughton, Essex. [89

Motor Cycle Police.

AFTER many years of hesitation and delay the authorities of Scotland Yard have decided to extend its force of motor cycle police. It is understood that the new arm will be employed for traffic control, and that normally they will be subject to the laws and regulations governing motor traffic. Quite naturally they will be permitted to exceed these regulations under special discretionary powers. Up till now only the sidecar outfits have been put in commission, and while offering our heartiest congratulations for this promising beginning we may express the hope that the venture may be still further enlarged both as regards scope and numbers.

We have often urged that the lead set by America, where large numbers of high-powered motor cycles are employed for police purposes, should be followed, but up to the present time the only development has been in Liverpool, where an organisation on the most modest lines already exists.

Scotland Yard has now set the fashion, which, we hope, will extend to all parts of the kingdom, since we are convinced that the utility of the motor cycle is not yet fully appreciated by the official mind.

Fluctuating Demand.

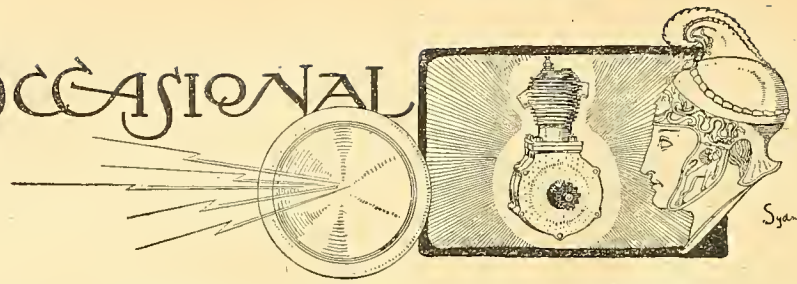
IT may occasion surprise to some of our readers to learn that in certain sections of the industry a shortage of motor cycles later in the year is anticipated. If all causes and effects are carefully considered there seems to be good reason to believe that such will be the case. The withholding of orders, on the part of the public, at the Show and in the first two months of the year undoubtedly has had an influence upon stocks of materials and units held by manufacturers. In this connection it must be remembered that even those firms with an abundance of raw materials for certain components may not have large supplies of other important parts without which complete motor cycles cannot be produced.

With the public postponing their purchasing, contracts for future supplies were considerably cut down, as only the largest concerns can afford to allow stocks to accumulate, and when these materials are required by any increase in demand, it may require considerable time to produce them.

While supply and demand are thus fluctuating so considerably, the prices of motor cycles will not become stabilised, and the public will not secure the same value for their outlay as they would if manufacturers were able to maintain a steady output all the year round.

Motor Cycles in Ireland.

THOSE of our readers who are able to enjoy the pleasure of possession and use of a motor cycle can sympathise with their less fortunate brethren across the St. George's Channel. In Ireland motoring is practically at a standstill on account of the present crisis and the efforts of the authorities to cope with it.



In some parts of the Emerald Isle a motor cyclist is compelled to hand over to the police a vital part of his machine in order to render it useless; while in Dublin, the fact that the Easter trial had to be confined to a radius of twenty miles is an example of the most favourable state of affairs existing at the present time.

It is not for us to suggest that the decisions of the authorities are unduly harsh or otherwise, but they are distinctly hard on Irish motor cyclists who are unable to use their mounts. It is, however, more serious for those members of the Irish motor trade who are now precluded from earning their living and, like the rest of that fair but unfortunate island, are faced with such conditions that did not exist even during the great war. The British manufacturers too are suffering from the cutting off of Ireland as an outlet for their productions.

With the rest of the civilised world, we hope a solution to this serious problem will soon be found, and that Ireland will come into its own again.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

By "IXION"

Combustibles by Post.

I HAVE had a slight fracas with the Postmaster-General, resulting from the delivery at the office of a charred envelope which had threatened to ignite the mails. Upon examination it proved that the contents of the letter were so vituperative that spontaneous combustion had almost occurred; probably the paper would have begun to smoulder if the letter had remained unopened another day. It was from a reader who went out for a long ride on a beautiful sunny day. *En route* he paused to adjust his clutch cable, and the next four hours were devoted to attempts to restart his engine. Finally, a good Samaritan showed him that the clutch cable in its new position was shorting his sparking plug.

Some Queries Answered.

MR. EVANS asks how I knew the names of the cars which dazzled me with their head lights on a recent night ride. Answer: the Rolls belongs to my tailor, and the Vauxhall to my grocer. "Petro" mocks at the reader whose machine ran half a mile after the tank had been filled with the latest fuel "petreau," *i.e.*, half and half water and petrol; I do not consider my correspondent's story quite impossible—a small engine will run a long way on the small amount of petrol contained by the carburetter and feed pipe, and his "half-mile" does not imply a measured 880 yards. Another reader does not believe that any dancer ever trod his partner's skirt off her waist. He must be young—there was a time when flying frocks created a barrage 6ft. in diameter round any waltzing couple; but I should explain that I live in the country, and patronise balls held at the village club, where the local censors deprecate the exhibition of too much leg. I quite agree that such a *contretemps* probably has not occurred at Murray's since 1914.

A Ford Motor Bicycle.

IN pre-war days I used to annoy the trade and render my Editor tremulous by prating about the possibilities of a "Ford" motor bicycle at £25 or so. Production costs have risen since then, and markets have narrowed, so that I dropped the fancy, which I supposed to have fallen on deaf ears. Now I find that great minds think alike. H. G. Hawker and T. O. M. Sopwith are firm believers in the ultimate application of the Ford policy to motor cycles. They are now busy on the cheap little two-stroke which bears the former's name, and which, it may be remembered, was described in the issue for Dec. 30th last.

It is a gross blunder to imagine the Ford is cheap and nasty. It may not do as much as a 30-98 h.p. Vauxhall, but it keeps on doing what it can do. There isn't an ounce of bad stuff in it, and its low price has no foundations in inferior material or second-rate workmanship. It is designed from stem to stern to absorb a minimum amount of first-class material and a minimum amount of labour. The Hawker baby two-stroke is planned on the same lines. Certain technicalities of design would not interest half our readers, but if I say that the tool box is a duplicate of the silencer, except that it is welded to the carrier instead of being jointed to the exhaust pipe, every reader will grasp that some ingenuity has been spent on securing economy without sacrificing efficiency.

On the Road.

RECENTLY I was able to try one of these urchins on the road, and found that its strongest point was the engine balance, which is quite unusually good. Forty miles an hour is probably its limit on top gear, but it climbs ordinary hills well at 30 m.p.h. and does not object to unlimited revving on low gear. I almost failed to coax it into four-stroking, but half throttle down a fair gradient occasionally interrupted the perfection of its firing, though never in the violent and obtrusive fashion familiar with some baby two-strokes. Accurate lubrication, a good carburetter, and a dose of brains in transfer design come near sounding the knell of the four-stroking nuisance.

Not Quite a Ford.

I HAVE devoted much space to this little machine because it is the first honest attempt I have encountered to translate Henry Ford's maxim into motor cycle terms. Of course, no baby two-stroke, however excellent, quite satisfies the typical motor cyclist. He wants 3½ h.p. and a sidecar. Still, a high-class £60 solo tourist machine, if not our long desired "everybody's machine," is a milestone on the road towards it.

The Long Exhaust Pipe.

I RATHER agree in principle with the magistrate who refused to be convinced by Mr. Howells on the subject of long exhaust pipes. As readers know, I have never seen eye to eye with those who clamour for inaudible motor cycles, but there are obvious limits to the amount of noise which we can reasonably make. In actual practice the average motor cycle equipped with a long exhaust pipe in lieu of the more usual expansion box and short exit pipe is not noticeably more noisy than the standard type, though notorious exceptions exist. Last year I owned a T.T. Norton with a long exhaust, which was no noisier than the average. But the trouble may come to a head this year, for quite a number of car manufacturers are fitting their sports models with silencers

Ixion's "MOTOR CYCLE REMINISCENCES" have lately been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

less outside exhausts; and these engines are tremendously barky when their throttles are opened. A member of *The Autocar* staff owns a 1921 car of this description, which is quite ladylike in traffic on top gear; but I should hate to take it up a steep street under the nose of a really alert constable. If such cars become common, some of them are sure to be carelessly handled, and their noisiness may develop into a public nuisance, especially at night. New regulations would then be forced upon the Government.

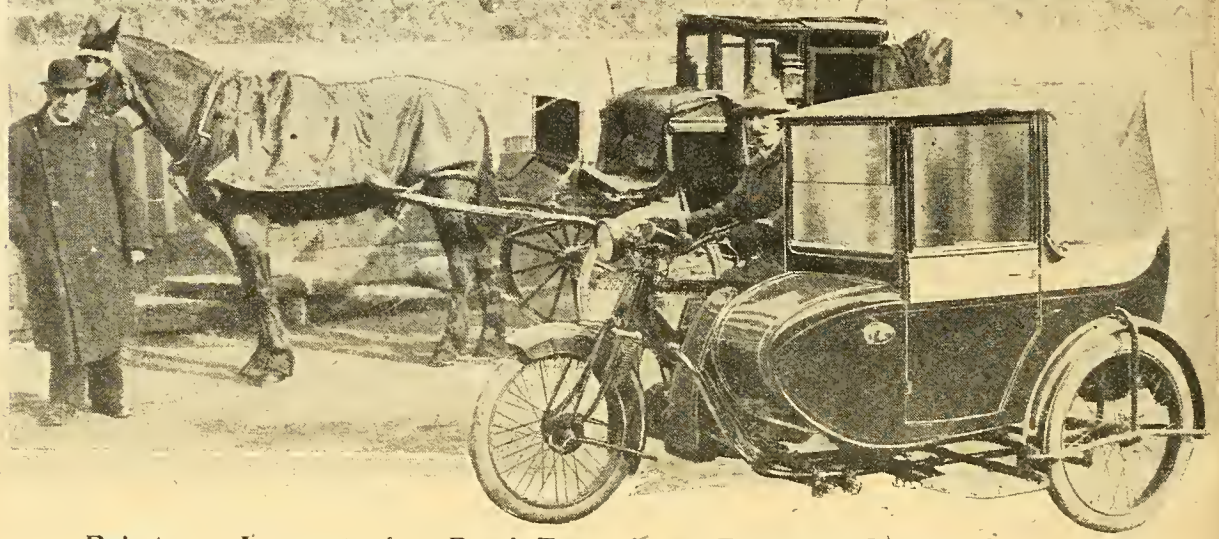
Soap Leaves.

VARIOUS correspondents, mostly feminine, deride me for my ignorance of "soap leaves." In conjunction with a powder puff these commodities explain why the little darlings look so fresh at the end of a long journey by contrast with the soiled and jaded appearance of the mere male. You extract a leaf from your pocket book of Oatine soap leaves: moisten it with the tip of your dainty tongue; rub your face over; and there you are.

The Needle's Eye.

THERE is something in the Bible about its being easier for a camel to get through the eye of a needle than for a rich man to pass the golden gates. This used to make me very unhappy until I had successfully worked through my patrimony and graduated in the garrets of Grub Street. So needless, too, for I learnt too late that the "needle" was not the sort they make at Redditch, but a kind of wicket to the gate in a city wall, so that a camel of moderate appetite and great determination would have a sporting chance. Anyhow, what I set out to say was the text returned to my mind on Easter Monday when I attempted to view the racing at Brooklands. An *Autocar* colleague offered to convey me thither on his racing car; and hoping that such a distinguished vehicle at my gate might rehabilitate my local credit, I accepted. I should estimate that when the gates opened, some 15,000 cars were queued up in single file Byfleetwards, and that ours was about number 14,872.

Poor Benedict.



THE queue moved a few inches every four minutes till the gates were closed for the first race at noon, when we remained stationary for a prolonged period. I began by rejoicing muchly that I had come on my colleague's car. The unfortunates who had ridden over on motor cycles had either seized their engines long before this, or else had switched them off to prevent seizure, and had begun to push. Immediately in front of us was a very small, meek man with a very large wife, in an 8 h.p. outfit: providentially for him the pace of the queue was low, or he would have had to lighten the ship by jettisoning his dynamo, detachable wheels, etc.

However, my personal rejoicings were premature. I have said that my colleague's car was a racer. Now a compression of six atmospheres, no pump, and no fan, hardly suit a speed of about 1 m.p.h. Most of the cars in the queue began to boil furiously. Ours angrily spat a few drops of scalding water from its vertical steam escape pipe, and anon ejected the entire contents of its radiator in a magnificent imitation of a fire engine. So the driver despatched me to bring domestic utensils full of water from neighbouring cottages; and until such time as the painful queue disgorged itself on to the track, I had to stand at the starting-handle ready to start up when we made one of our periodic five yard advances. The entire engine being incandescent, gentle reader, you may imagine how it kicked. Long before I got into Brooklands I felt a mad envy of the meek little sidecarist.

In between the different sections of reliability trials there are many stretches of good roads through interesting country. Here are shown W. A. Fell-Smith (8 Rex sc.) and another competitor in the recent Victory Cup Trial descending from the British camp, near Malvern.

ROAD TESTS of NEW MODELS

Being an Account of a Road Test of the Excelsior Sidecar Taxi under Touring Conditions.

SPECIFICATION.		
ENGINE: 85×88 mm. (998 c.c.) twin Blackburne.	*CARBURETTER:* Amac or Senspray	*FORKS:* Druid.
LUBRICATION: Drip feed.	*GEAR BOX:* Three-speed Burman.	*FRAME:* Rigid.
MAGNETO: M-L.	*TRANSMISSION:* ⅜in. chains	*WEIGHT:* 328 lb. solo
	WHEELS: 28×3in.	*PRICE:* £258.

THE prohibition of sidecar taxis in the Metropolitan area has caused considerable comment amongst all who are interested in economical forms of travel, and it would appear that the real reasons for the veto are yet to be explained. On the question of safety, at any rate, there is little to be said against the modern sidecar taxi.

As an outcome of a discussion on sidecar topics we gladly accepted Mr. Carson's offer of a day out on one of the latest Excelsior sidecar taxis, as accepted by the authorities of various provincial centres. On the day appointed Mr. J. W. Walker, one of the directors of the manufacturers, arrived with a luxurious outfit and, led by Mr. W. J. Carson on a standard 8 h.p. Excelsior sidecar outfit, we set out for Edge Hill.

Hill-climbing Capabilities.

Our object was to test the comfort, handiness, ease of stopping and general reliability of the taxi under strenuous conditions, and it was decided that mere traffic test were not sufficient to satisfy all demands.

Therefore Carson set a hot pace, with the result that the summit of Edge Hill was reached from Coventry in a fraction over the hour. Friz Hill was taken with ease on middle gear, and, though the low gear was needed on Edge Hill, the ascent was made at a good round pace.

In order to make the test more complete, the driver of the standard outfit was pressed into service as a second passenger, and without waiting to cool off, the hill was descended and climbed again with full load, a performance well within the power of the engine.

Braking.

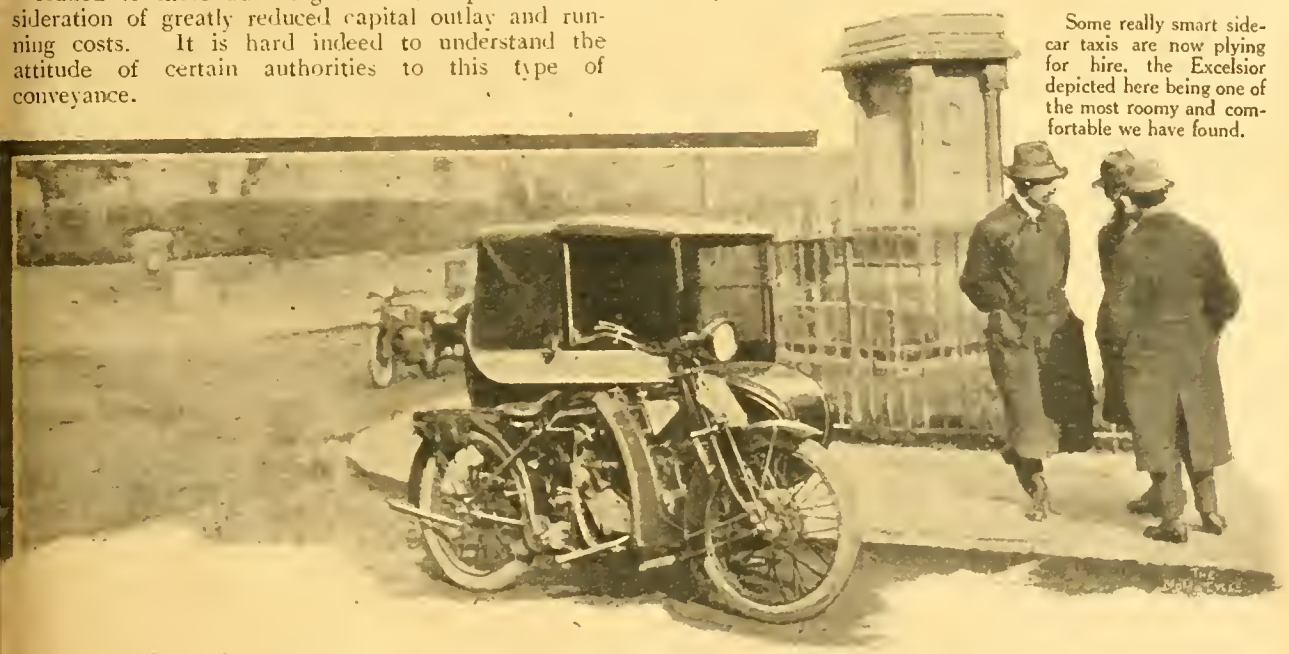
From Edge Hill to Stratford-on-Avon we occupied the saddle, and the change from the luxurious interior of the roomy draughtless body to a raw blustering exterior was not appreciated. The descent of Sunrising offered ample opportunities for testing the brakes. A large internal expanding brake is now fitted to the front wheel, and in future will also be fitted to the sidecar wheel. The front brake is foot operated, and either front or rear brake will easily hold the outfit on the steep descent, while if both brakes are used simultaneously the machine can be brought up "all standing" in a remarkably short distance.

A strong headwind now caught the two-seated cabriolet body, and for the next ten miles the engine

Road Tests of New Models.—

had hard work and plenty of throttle; nevertheless, the 8 h.p. Blackburne seems to enjoy this sort of load, and was not a whit the worse for its gruelling. We found the Burman gear box to be quiet and easy to handle, and the clutch worked smoothly and sweetly.

Handling the machine is ridiculously easy, the steering is light, and there is no chance of turning over such a weighty sidecar on left-hand corners.



Where the Sidecar Taxi Scores.

Birmingham traffic showed off the handiness of such an outfit to its best advantage, and it can be said that the sidecar taxi is as safe as and more "nippy" than its four-wheeled prototype, both in traffic and on the open road.

Added to these advantages is the important consideration of greatly reduced capital outlay and running costs. It is hard indeed to understand the attitude of certain authorities to this type of conveyance.

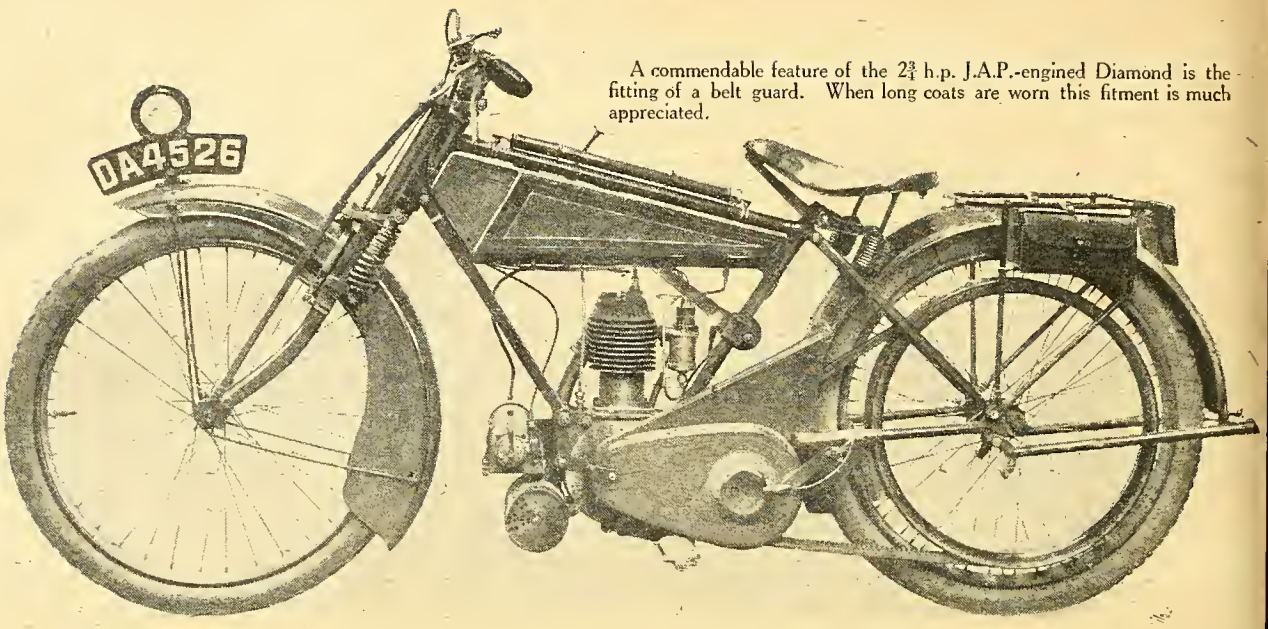
With regard to comfort. The canoelet body is certainly more comfortable with the weight of two passengers on board than with one only. It is, however, reasonably well sprung under all circumstances. There is head room for a tall man, access to the interior is easy, and the body is singularly free from rattles and draughts. The family man who wishes to provide luxurious riding for his wife and children might do much worse than consider the merits of an Excelsior and canoelet sidecar taxi as a touring proposition, since it is admirably adapted for all ordinary work.

At the conclusion of our run we were able to examine the manufacturing methods and the sturdy construction of Excelsior machines throughout, and incidentally to try the paces of a new sporting two-stroke on the company's miniature track.

Some really smart sidecar taxis are now plying for hire, the Excelsior depicted here being one of the most roomy and comfortable we have found.

THE 2¾ h.p. DIAMOND-JAP.

On the Road with a Small but Efficient Four-stroke.



SPECIFICATION.

ENGINE: 70 × 76 mm. = 293 c.c. single cylinder J.A.P.	*TRANSMISSION: ½ × 3/16 in. chains and ¾ in. belt.*	*TYRES: 26 × 2¼ in.*
CARBURETTER: Amac.	*GEAR BOX: Two-speed Sturmey with clutch and k.s.*	*FORKS: Druid*
MAGNETO: C.A.V.		*PRICE: £89 5s.*
		WEIGHT: 230 lb.

TWO-STROKES are so popular in the 200-300 c.c. classes that the four-stroke lightweight of corresponding capacity does not attract nearly the same amount of attention nowadays from the general public. Its performances and capabilities are, like those of its larger brother the 3½-4 h.p. single, simply taken for granted; that these qualities, if unassuming, are not negligible was amply proved on the occasion of a test quite recently of the 2¾ h.p. Diamond-Jap.

Although nominally 2¾ h.p., this little engine is only 70 × 70 mm (293 c.c.), and therefore is considerably smaller than the majority of similarly rated lightweights. Power output, however, seems to indicate that the rating is still on a modest basis. Indeed, on the road with a heavy driver and a 5 to 1 top gear, the Diamond gave that untiring service which we expect, and get, from any of the larger singles of to-day. Naturally, it has not the speed of a high efficiency "3½"; but a maximum of 40 m.p.h. must be considered very creditable for so small an engine, and with so low a petrol consumption.

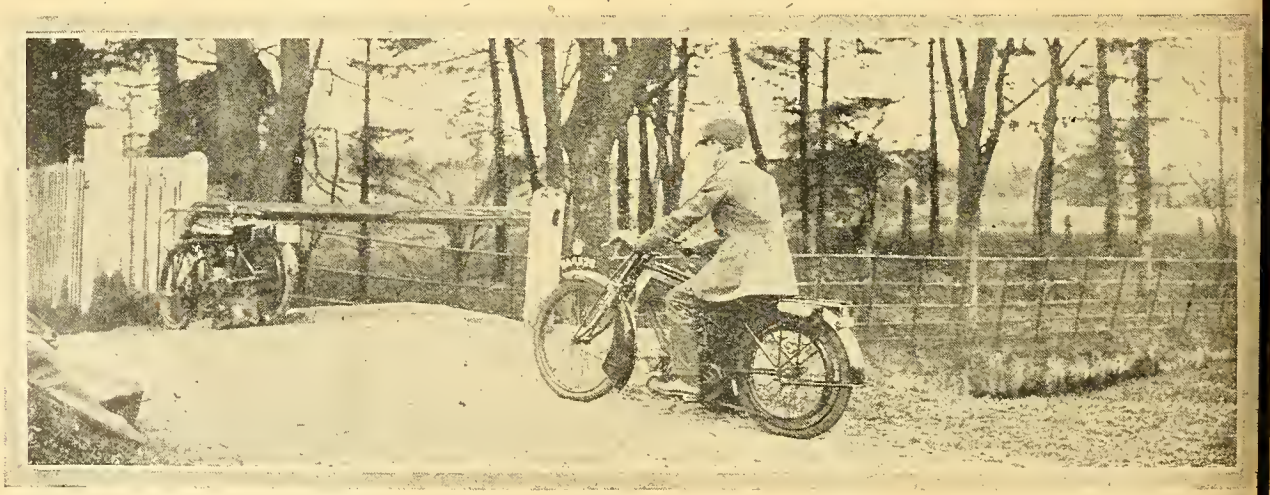
This latter point, in fact, is where the Diamond scores most pronouncedly; and although a considerable

A commendable feature of the 2¾ h.p. J.A.P.-engined Diamond is the fitting of a belt guard. When long coats are worn this fitment is much appreciated.

number of ten and fifteen-mile runs were made on the machine by the writer, he never succeeded in running the large capacity petrol tank dry. Like the Biblical cruse of oil, the level seemed to remain almost constant. Thus, by reason of its very economy, we were unable to obtain exact consumption figures; but certainly everything pointed to a very satisfactory result.

Weather-proofing and Braking.

The general design of the Diamond is noticeably good; and every attention has been directed to making it a suitable all-weather mount for the busy man or the novice. Mudguarding is both extensive and securely carried out, and a combined front chain-guard and belt-shield is a most useful fitment for the rider who wishes to ride in his ordinary waterproof or overcoat. Braking is simple but effective, a long heel lever being connected directly to the rear brake shoe. Thus the action is literally direct.



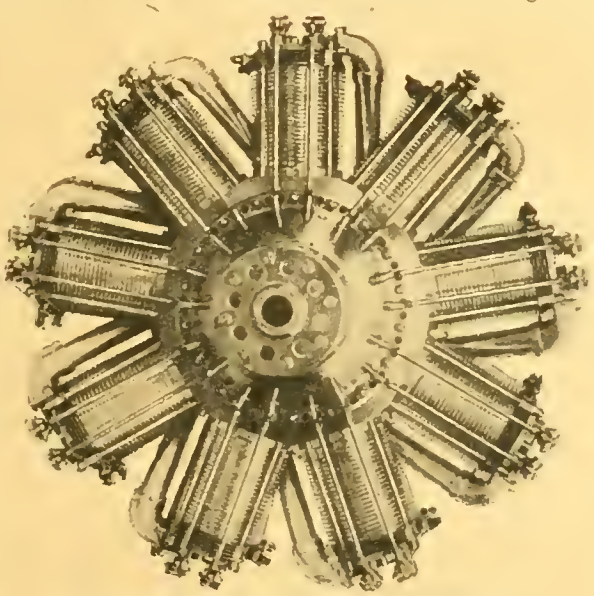
Druid forks and Sturmey two-speed gear box are too well known to call for much comment, although it must be stated that "closer" ratios would have served our purpose admirably.

Gradient and Gear Ratio.

This is often the case, however, on two-speed machines; and, actually, it is complimentary to the engine that we should regard it as undergeared on low.

Other items worthy of note are the very large and good quality tool bags, the integral front number-plate and licence holder, and, finally, the built-up front portion of the frame, which replaces the conventional brazed-in single tube with a duplex arrangement secured by bolts to the steering head; this construction should do much to eliminate the possibility of front down-tube breakages.

Altogether, both in performance and finish, the Diamond lightweight strikes a high note—it combines sturdiness and reliability with economy and handiness.

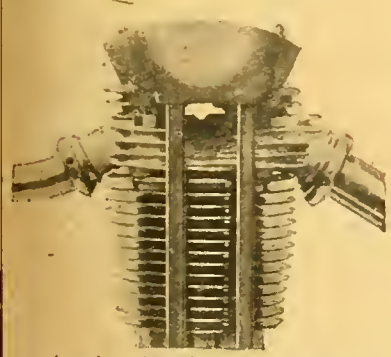


As an economical and handy little mount, the Diamond takes a front rank

IS AIR-COOLING ADEQUATE?

What has been Done and What is Needed in Practice.

By ROAD RIDER.

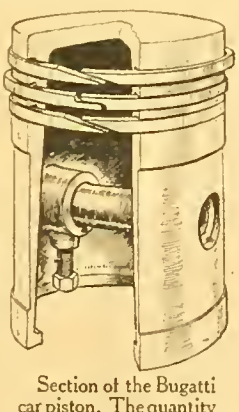


THE judges' report of the first post-war Six Days Trial (1919) went out of its way to suggest that motor cycle designers should reconsider the whole question of cooling. These magnates had been greatly impressed by the fine performance of the water-cooled Scotts over a very trying Welsh course; and they had been correspondingly disgusted by the hot, oily smell and the very audible conking which their test precipices wrung from some of the air-cooled entries. Since that date certain research data have been published, most of them emanating from what is known in the R.A.F. with either affection or derision as "the factory," *i.e.*, the Royal Aircraft establishment at Farnborough. These researches have wholly transformed the situation. You can still find men who prefer water-cooling for certain purposes, *e.g.*, a "heavy duty" two-stroke; but it is no longer possible to assemble a board of technical experts who consider water-cooling necessary, or even desirable, for the ordinary commercial motor cycle.

A 250 h.p. acro engine which is satisfactorily air-cooled. The production of such power units is necessarily expensive.

Under-cooled Engines Still Exist.

It is still a fact that some air-cooled engines sold to the public are under-cooled. Their existence is due to a variety of causes. For one thing, it is thought cheaper for a motor cycle manufacturer to make an engine than to buy a proprietary unit. In the past some very poorly qualified engineers have been given the job of designing an engine for firms who desired to enter the industry or to lower their costs. Friends of mine, who were little more than students, have received and fulfilled such commissions before now. With keener competition this atrocious practice is moribund. But every now and then a man who is ignorant of the latest principles tackles a job in which he cannot hope to succeed. Secondly, no commercial motor cycle need avail itself to the full of air-cooling possibilities. Certain designers can make, and have made, air-cooled engines capable of running under a good load for several hours inside a building from which all cooling draughts are excluded. Such a test is far more severe than any which roadwork in these islands can produce; commonsense permits such an engine to be cheapened and simplified for commercial purposes. But different makers have different standards. I suppose that if the Alps were situated in the immediate hinterland of Coventry, all our engines would prove under-cooled, and we should see marked changes in design. As Britain contains no hills which are both very steep and very long, the average designer wastes no money on over-cooling his engine. His very sensible standard is that it shall take a side-car up Sutton Bank in August with a duffer at the helm, and show no sign of conking in the process. So long as this standard is actually attained, what more do we want? The Farnborough ideal is that air-cooled cylinders of 50 h.p. apiece must withstand full load for many hours continuously without shedding any efficiency; even Brooklands makes no such demand of our little engines.



An adaptation of acro methods of construction to a motor cycle engine. The Metric unit has a bolted-on aluminium head with worm-driven overhead camshaft

Causes of Distortion.

It follows that the design of an air-cooled engine is, to a very large extent, like most elements in design, a matter of compromise.

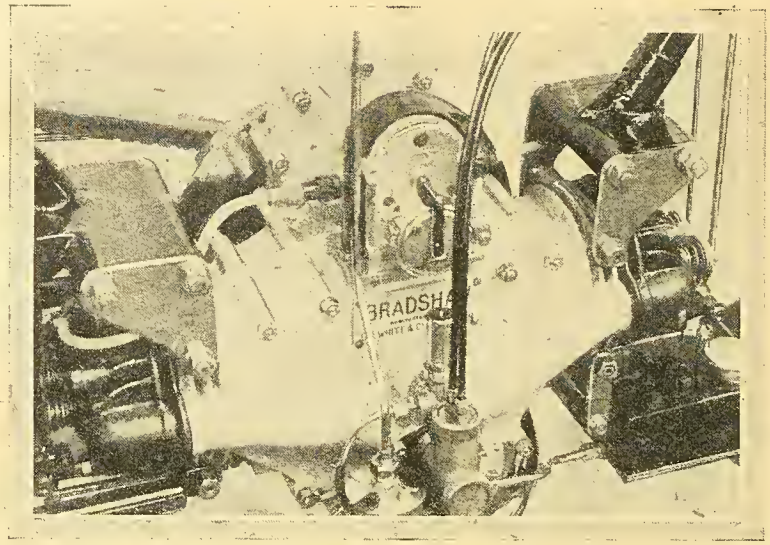
Take distortion of the cylinder barrel as an example. A cylinder barrel may be "pulled out of round" by at least four factors:

1. Uneven thickness of the barrel (*e.g.*, an exhaust valve chest which makes its cross section lob-sided).
2. Unequal draught (the draught on the front and rear walls can be equalised by cowls or "wind shoots").
3. Unequal conduction of heat from the cylinder head (due to the exhaust valve being out of centre).

Section of the Bugatti car piston. The quantity of metal is so disposed as to give the greatest cooling effect to the head.

Is Air-cooling Adequate?—

4. A hot spot down one side (*e.g.*, the side exhaust valve).



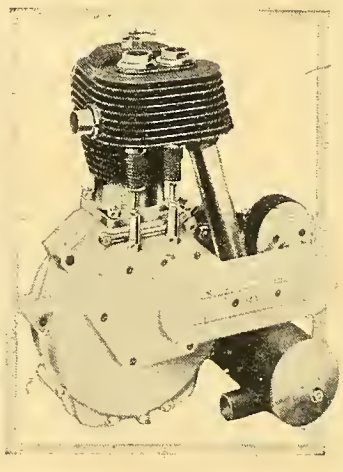
For R.A.F. purposes, where the cylinder bore must remain true under the most acute stresses, all these points must be safeguarded. The ideal R.A.F. cylinder barrel might therefore be:

1. Machined inside and out (very costly for application in a motor cycle factory).

2. Provided with cowls to equalise the draught (ugly and expensive on motor cycles).

3. Be fitted with a central exhaust valve or the Bradshaw aluminium washer at the head joint (to prevent the head from wrenching the barrel out of round).

4. Be fitted with overhead valves (which are awkward to accommodate on a big single-cylinder engine to suit a motor cycle frame).



Air-cooling is not sought entirely in this Bradshaw engine (designed by the well-known aero engineer), for the crank case encloses the greater part of the cylinders, which are cooled by a large quantity of oil in circulation.

Since a motor cycle engine need not reach this lofty standard there is a far simpler way of equalising the cylinder temperature all round the barrel and avoiding distortion; it might not suffice for an aero engine, but it will keep a cylinder true on a sidecar outfit all the way up Applecross. Two types of heat conduction occur in a cylinder barrel; there is *external* conduction from the barrel to the air; and there is *internal* conduction or "heat circulation" between the atoms composing the metal. So if the cylinder walls and fins are made tolerably thick, the casting need not be machined on the outside; the valves need not be transferred to the overhead position; no cowls need be attached; and the cylinder will still remain true under all road tests. Obviously, this simpler method of construction is far cheaper than that of a special "stunt" engine.

Cylinder Head Construction.

Or take again the construction of the cylinder head. One fertile cause of conking is a hot spot in the cylinder head, which, needless to say, is always located round the exhaust valve. Various dodges for preventing deformation of the head have been devised; we must remember that an unequally heated head usually means an "out-of-round" cylinder. There are engines with Eiffel towers of special fins on the head; engines with central overhead exhaust valves; engines with the exhaust valve in front and the inlet valve behind; and so forth. But for motor cycle purposes a perfectly conk-proof engine may be obtained by using a good fat cylinder head, which gives good heat conduction inside the metal, so that the temperature at all points is as nearly equal as good practical results demand.

Standard motor cycle engine practice in a highly-developed form is exemplified by the single-cylinder Norton. The cylinder casting is heavy, and the radiating fins increase in area at the hottest points.

Once more the piston is intimately concerned in the matter; and the section of the Bugatti racing piston, reproduced, indicates how a thick head, tapering off gradually into the skirt, will carry away the excess heat from the crown.

Possibilities of the Future.

To sum up, by utilising all the known dodges, it is possible to design an air-cooled engine which will stand harder duty than any water-cooled engine. In the latter case, the boiling point of water—212° Centigrade—is the absolute temperature limit, while a stunt air-cooled engine will function perfectly up to temperatures at which the lubricating oil ceases to lubricate and begins to "crack," or separate into its constituent parts—petrol, wax, and the like. Therefore, if a 1921 motor cycle engine overheats and conks, the user may decide between several alternatives somewhat as follows:

1. The engine is badly designed.
2. The engine is mechanically amiss.
3. The engine is being subjected to stresses for which no sane designer would cater.

But in no case will the A.C.U. judges of 1921 recommend the trade to abandon air for water.

It has taken a long time for motor cycle designers to appreciate the fact that much of the experimental work carried out during the period of the war is at their disposal for future reference, but some there are who, realising the facts, are beginning to make use of their opportunities. Most interesting and instructive lectures have been given before the Institution of Automobile Engineers, which in certain cases would have been of more use to motor cycle than car designers had they been attended by responsible members of the drawing office staff. Just a few concerns have arrived at first-class results by the lengthy and wasteful process of hit and miss, when a short cut to the same ends might have been used by the employment of available data

FOUR DAYS ON THE ROAD.

Being the Week-end Ride of One of "The Motor Cycle" Staff engaged on the London-Land's End Run.

GOOD Friday was meteorologically a very good Friday—in the Midlands, anyhow—and my leather coat and field boots seemed most unfashionable as I sped down the Stratford-on-Avon road past hatless joy-riders with "river-girl" types up behind.

Everything seemed in favour of an uneventful run to the south, but on entering Shakespeare's old home town it became necessary, for some forgotten reason, to declutch. Performing the action correctly, nothing happened. I knew just which inaccessible locking-ring had come unscrewed, for the same trouble had happened before. (It is not a Sturmey nor the gear box made by the manufacturers of my trusty W.D. Triumph.) I turned into a near-by garage to have things put right. A veil may be drawn over the next two hours; I did the job myself, and so many times did I get the clutch nut on cross-threaded—the spring had to be compressed at least threequarters of an inch—that eventually I came away with the nut only half-way on, but seemingly immovable either way. So it proved; it has not been touched since.

Fourteen miles further on two energetic, if slow, policemen were holding up a string of motoring holiday-makers while compiling voluminous notes, in very longhand, regarding licences, vehicle, and driving. I was presented with a "ticket of leave," which I promptly lost. However, at each further hold-up—and there were many—I simply fumbled with a gloved hand in my breast pocket, mentioned the ticket, and was waved on, generally before stopping the road wheels.

WATCHING FOR LATE ARRIVALS AT LAND'S END.
Competitors bearing the earlier numbers waiting for others to finish their strenuous ride.

Good Going.

After Moreton-in-the-Marsh the route lay for twenty miles down the old Fosseway to Cirencester. Without dangerous "blinding," these twenty miles took just thirty-five minutes.

Replenishing both "W.D." and myself at Cirencester, good, if dusty, running was made through Malmesbury and Chippenham to Bath, and onwards through some nice country to Wells. It was only four when we reached the square in front of the Cathedral, and, therefore, although not greatly interested in archæology, I made the official tour of that edifice, then washed the dust down with some tea at the Swan, and generally lazed away nearly ninety minutes amongst a typical summer-holiday-like crowd of motorists and tourists.

Bridgwater was reached in good time, and arrangements made for a lamentably early start on the morrow. An important local rugger match and various camp-followers of the M.C.C. trial made things unusually lively that night. Some of us went for a moonlight walk and made vain prophesies regarding weather conditions on the hills.

Under Difficulties.

Next morning, as everybody knows, it rained, and even before I reached Porlock—and I came along with the "teens"—the roads were just as wet as they could be. What the surface was like on that dread acclivity itself, I confess, I cannot say. My ascent must have been rather amusing—for the spectators: although I still hope that the rain was heavy enough to obscure me completely. It certainly obscured my vision; and as I wear glasses. I stopped and cleaned them at the foot, but so heavy was the shower that it did not help for long. Before I realised it I was rounding—or should have been rounding!—the first bend. Actually I ran into the ditch. I rather think I was still in second gear then: and probably it was instinct which made me declutch before I had charged the bank, or the engine had stopped. Fortunately the engine did not stop, and willing hands helped me to get away, on low gear this time.

For about a mile I went up well, and only a conking, on repeated attempts to get into top, caused me to realise that the climb was not yet over. (I would remind the reader that I could not even see the sides of the road, and was quite unable to judge as to the gradient.)

At the summit it was clearer, and presently the rain stopped. My journey to Lynmouth was speedy and skid-less, and, greatly to my relief, Lynton proved ridiculously easy. I made a perfectly clean ascent, and leaving my mount at the top walked down to the hairpin to report to a colleague. It was most soothing balm to my pride, somewhat hurt on Porlock, to see so many make a mess of things here!

Lynton and After.

Lynton must be the finest hill in England from the spectator's point of view: almost all the comedies or thrills are staged within view of the grandstand—the bank on the inside of the bend. I should like to have stayed until the last car came along, but duty called, and, tramping up the 1 in 4—hard work—I

Four Days on the Road.—

was soon *en route* once more with the competitors for the lunch stop at Launceston.

Bideford was the next name to stamp itself indelibly in the memory of all—not for any special feature about the village or the villagers, who turned out in great force, but because here the road took a serious turn for the worse. Right on to Holsworthy there were stretches which only possessed a narrow rideable track in the centre. Tired solo competitors, perhaps shaken by Porlock or Lynton, found great difficulty in keeping upright on this section, and many spills resulted. Incidentally, I was forced to the conclusion that the 28 × 3in. rear tyre I have fitted to the Triumph is a preventive of skidding, for this section was survived without a fall.

Both roads and scenery changed after Launceston, the former very much for the better. Indeed, so good were they now that I had some difficulty in restraining "W.D." from catching up and passing No. 1. The competitors themselves went very warily, expecting another secret check before the finish. It came just before Penzance; and after Penzance 20 m.p.h. was about the safe maximum for the road anyhow.

Even twenty proved deadly to one promising young cockerel near the finish; he could not quite touch twenty across the road, and the wheel that wrung his neck was not doing more.

Land's End is a lovely spot, but on Saturday night was rather cold. Those who had not booked up were quickly on their homeward way; incidentally, there was considerable grumbling about the regulation (strictly enforced) requiring the removal or reversal of the official metal number-plates before moving off. Personally, I made capital out of someone's misfortune, for I secured the room of a car driver who had not arrived.

TWO FAMOUS WEST COUNTRY HILLS WHERE THE AWARDS WERE LOST OR WON.

Three-wheelers did well throughout the London-Land's End Trial. Here are depicted the familiar Morgan and the Coventry Premier on the lower portion of Lynton Hill. (Circle) A Coulson B between the bends on Porlock.

Four Days on the Road.—

Sunday morning dawned breezy but fresh, and an intended very early start was actually made at 10.30. Much to my dismay I discovered before starting that all my tools had gone the day before from an insecurely locked tool-bag; worse still my front tyre went down just beyond Penzance. Buying tyre levers and a spanner from various sources, however, I carried on, pumping up every twenty miles—being too lazy to mend it. I took a more southerly route on the return than on the outward journey, through Lostwithiel and Liskeard to Tavistock, passing and being passed by returning competitors every few miles. At Tavistock lunch was obtained easily, but food for the machine took a good deal more finding; eventually an obliging hotel hand broke into somebody's garage and supplied an overflowing gallon. It was needed; for on across glorious Dartmoor *via* Two Bridges to Ashburton there is no profusion of petrol stand pipes.

Welcome Aid from the A.A.

Nearing Exeter the miracle happened: I came across an A.A. "mechanical first-aid" sidecar, and on production of my membership card the patrol got busy with the tyre. It is most satisfactory to watch another mend one's puncture!

Tea at Exeter was a gathering of nearly twenty who had come from "the End" by almost as many varied routes. Faces that we dare not wash and eyes that were red and sore must have made the good people of Exeter quote Shakespeare regarding mortals and fools. But everybody was happy, so what matter?

That night I stayed at Taunton, and next morning at Glastonbury rejoined my outward route. I also struck rain and with it a sticky contact breaker. An inadequate tool kit enforced a continuance of the journey without getting to the root of the trouble. At Cirencester the ignition became still worse, but a rapid mental calculation showed that if I only averaged fifteen I could still reach Coventry with two hours to spare in which to deliver to the Editor those notes I had travelled so far to obtain.

Still Wanted—a Hoseable Machine.

Actually I averaged twenty on this final section.

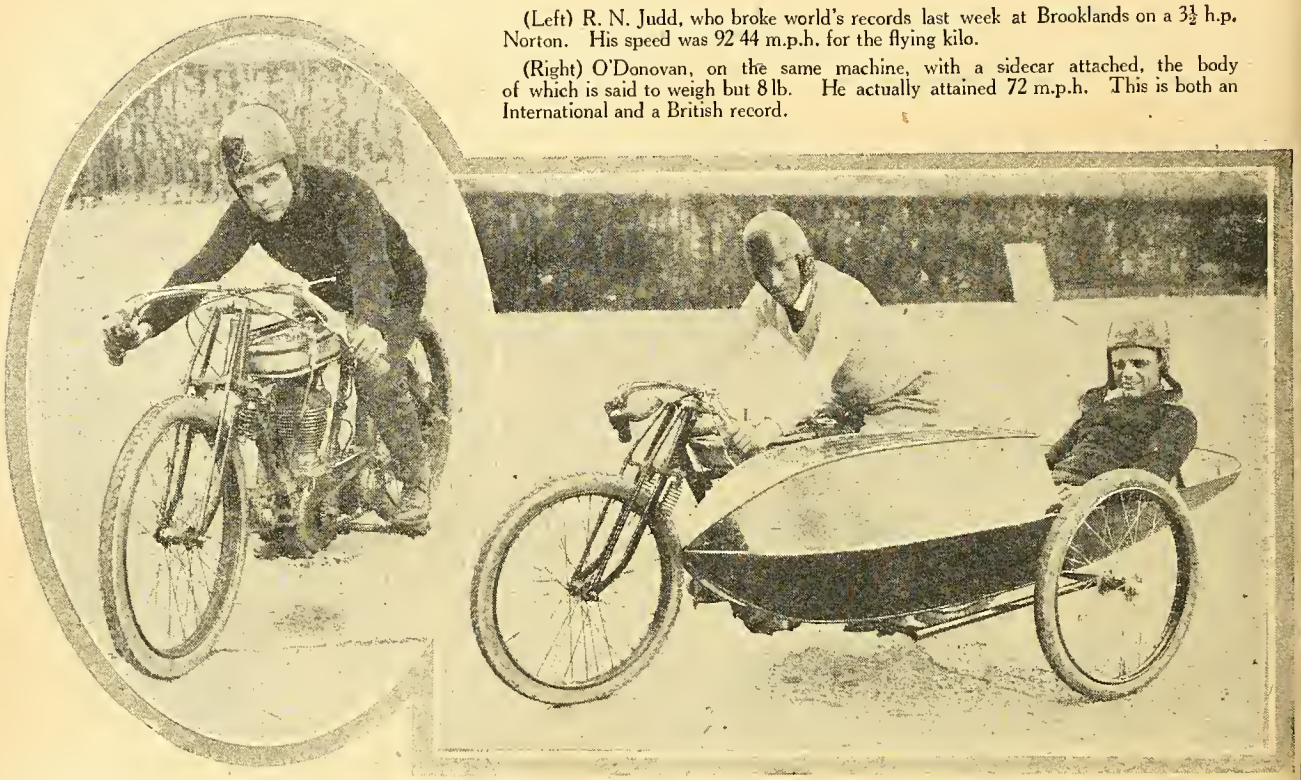
And so finished a 600 mile journey, more than half that distance with only two pedal cycle tyre levers and one weak and wobbly pedal cycle spanner. One must be fairly confident of the machine to venture such a ride with such a tool kit. Regarding the machine, an hour's work will fix it up in splendid tune once more: but—it will take days to clean. When Porlock and Lynton are tar-macadamed, and the M.C.C. only comes out in fine weather, "London-Land's End" will be the perfect Easter holiday.

Speaking generally of my impressions of the trial, there are one or two points that I should like to emphasise. I consider that it is much too severe for lady sidecar passengers; one lady fainted, and all must have felt worn out at Land's End. The return journey, too, is just as long! On the hills, and on Lynton in particular, many big, hefty machines came to a standstill owing to too much throttle on low gear. A big twin in particular should go up on a mere whiff over the worst portions, only opening out when the surface improves and the gradient eases. It also seemed to me that more awards were lost through bad driving than through any mechanical faults. On Lynton, particularly, it was evident that many competitors got "flustered;" and did not "use their heads." Finally, touring handle-bars on solo machines should be suppressed by a special regulation. A.Mc.L.

A Zenith rider at Staxton hill-climb, W. C. Brown in racing form. He secured second place in Class 5. The results of the hill-climb were given last week.

PARIS-NICE STATISTICS.

ACCORDING to statistics published by a French contemporary, forty-one French machines started and twenty-eight finished the journey in the recent Paris-Nice Trial. Nineteen lost no marks.



As regards the British machines, twenty-seven started, twenty-four finished the course, eighteen lost no marks, and six were penalised.

Twelve American machines started, eight finished the course, four lost no marks, and four were penalised.

Of the Swiss machines three started, two finished, of which one lost no marks and the other was penalised. The Belgian team of three machines finished complete, and lost no marks. Two Italian machines started, one of which lost no marks and the other was penalised.

OVER 92 M.P.H. WITH A "3½."

R. N. Judd beats International Records at Brooklands on a 3½ h.p. Norton.

(Left) R. N. Judd, who broke world's records last week at Brooklands on a 3½ h.p. Norton. His speed was 92.44 m.p.h. for the flying kilo.

(Right) O'Donovan, on the same machine, with a sidecar attached, the body of which is said to weigh but 8 lb. He actually attained 72 m.p.h. This is both an International and a British record.

SOME startling performances were made on Brooklands Track by R. N. Judd on a standard Model 16 H Norton on Wednesday of last week. The track was wet, it was raining somewhat at the time, and a cold south-westerly wind was blowing. Notwithstanding these adverse conditions he covered the flying kilometre in 24.2s., which equals a speed of 92.44 m.p.h. (148.76 k.p.h.), which is a British record. The average time was 25.9s., 86.37 m.p.h. (138.99 k.p.h.), which is an international world's record. Judd's best time for the mile was 41.2s., 87.38 m.p.h. (140.62 k.p.h.), his average for the two times being 43.1s., equalling a speed of 83.53 m.p.h. (134.42 k.p.h.), and is an international world's record.

The importance of Judd's performances is that they beat the American Class C records standing previously in the name of E. Walker, made on April 15th, 1920, on Daytona Beach. Walker covered the flying kilometre on a one-cylinder Indian, 82.5 mm. × 93 mm., 497 c.c., in 27.21s., being a speed of 82.21 m.p.h., and the flying mile on a similar machine in 43.85s., equalling 82.09 m.p.h.

Judd used Pratt's petrol, Speedwell oil, and Dunlop tyres.

On the following day, and under more favourable weather conditions, D. R. O'Donovan, riding the same machine, but having a sidecar attached, succeeded in breaking further records as follows: Flying kilometre—speed 30.8s. = 72.63 m.p.h. (116.88 k.p.h.); mean speed (both ways) 31.4s. = 71.24 m.p.h. (114.65 k.p.h.), thus beating H. R. Davies (2¾ A.J.S.-sc.), whose record, made at Brooklands in October, 1920, stood at 62.84 m.p.h. (101.12 k.p.h.).

THE FIRST MIDLAND OPEN TRIAL.

IF the entry lists of the closed Midland Centre events are any criterion, all records should be broken on the occasion of the first open Midland reliability trial, which takes place on Saturday, April 23rd. Excepting the team prizes (trade and club or private riders) there are no special awards; gold centre medals will be awarded to all who gain full marks, silver to those who gain 90% marks, and bronze for 75% marks. The event is open to motor cycles and sidecar outfits of any size and weight, and three and four-wheeled runabouts up to 1,100 c.c. engine capacity, and 8 cwt. unladen weight.

With a view to affording entrants a knowledge of how their performances compare with others a fully detailed schedule of every rider's performance will, after the trial, be sent to each entrant. This appears to be an excellent idea, and one that should be more freely adopted by other bodies.

Entries must reach Mr. E. Boydell, 93 John Bright Street, Birmingham, by the 11th inst.

NEW B.M.C.R.C. RULES.

AT a recent meeting of the committee of the British Motor Cycle Racing Club, held at the Auto Cycle Union offices, the proposed new racing rules were finally adopted. These are seventy-six in number, and should prove a model of what such rules should be. Outstanding among the new regulations is one requiring that all motor cycles entered for contest at Brooklands track shall have their engines registered before they can compete. This should definitely bar the possibility of any objectionable practices, and should add to the general interest of observing the performance of the machines. One may easily imagine that, to the closer and more enthusiastic observers at any rate, particular engines will eventually become famous, by reason of their long record of successes or other outstanding performances. Such a scheme will imply, of course, that all vital alterations made to an engine during the season will have to be certified.

A TRIAL IN SOUTH WALES.

Neath and District M.C.C. Reliability Trial to Llandovery and Back.

Although fairly deep watersplashes were included, they gave very little trouble to competitors. Ivor Church (3½ Sunbeam) negotiating Caio watersplash.

Alex Thom taking the bend on Porthrydd Hill on his Harley-Davidson sidecar.

'HE announcement that a really handsome challenge cup had been given as the premier award for the Neath ub's Easter Reliability Trial by Mr. an Williams, a well-known sportsman, ed as a good stimulant to the members the South Wales clubs; and, although t favoured with brilliant sunshine, the ather was sufficiently good to make the thoroughly enjoyable for competitors, porters, and onlookers.

At 10 a.m. the first man Thomas Triumph) left Neath. Some good main d hills were covered, and at twenty-ee miles (the first check) most competitors thought they were in for a joy le. The well-known Caio Hill had not en considered sufficiently severe to be served.

Caio water-splash caused some fun the spectators), No. 13 providing tertainment by trying submarine ethods, but most of the competitors t through without trouble.

The tit-bit of the trial was the climb Porthrydd mountain, of which, after t weather, the first 200 yards were almost unclimbable, being just a mountain lane, partly covered in by trees. The best ascents were made by Idwell Jones (3½ Sunbeam) and Thomas (4 Triumph). A very plucky attempt was made by Lewis (2¼ Levis). All sidecars failed, but White (7-9 Harley-Davidson sc.) had exceedingly hard luck with wheel slip.

Amongst the Mountains.

On the rough, rocky surface over the crest of the mountain, Idwell Jones (Sunbeam) punctured badly, and retired after excellent going. Castle Hotel, Llandovery, was then reached, where the host had an excellent lunch awaiting.

After lunch, competitors were checked at Senny Bridge Station, after which came some cross-country running to a magnificent climb at Moel-Senny (1,468ft.). This hill has two hairpins, really good surface, and provided an excellent engine test. Some of the most gorgeous scenery is available from here.

Excellent solo climbs were made by Thomas (4 Triumph), Lewis (Levis), and Church (Sunbeam); and among the sidecars Thom (7-9 Harley-Davidson) was very fast, and White (7-9 Harley-Davidson sc.), Thomas (3½ Norton sc.), and Mitchell (7-9 Indian), all climbed well. Stewart (3½ Sunbeam) was steady but sure.

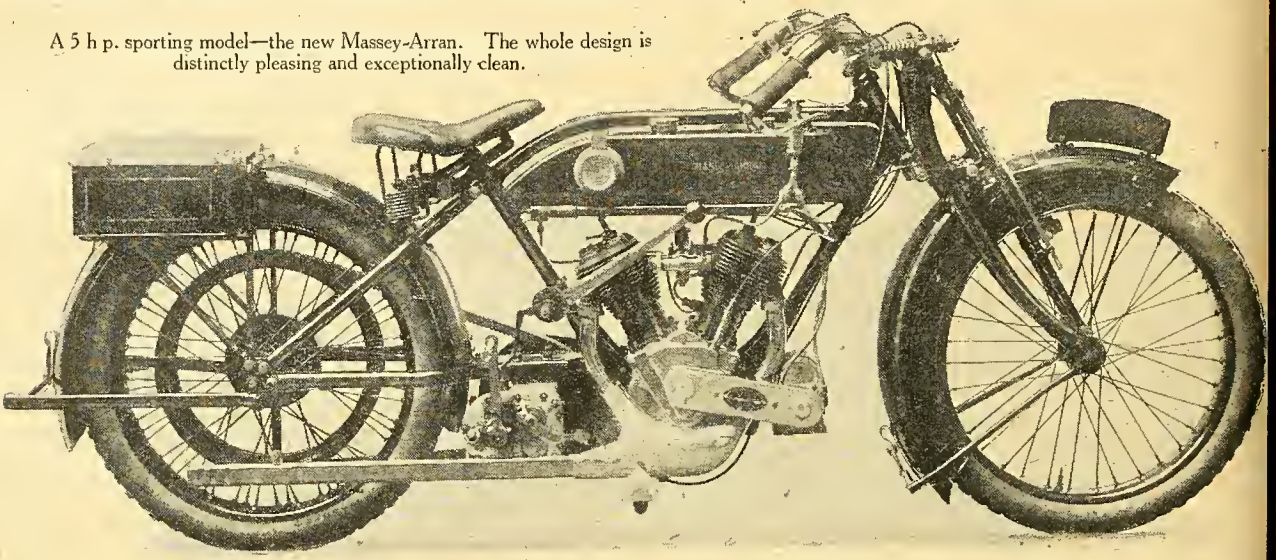
Several miles of mountain road, with numerous cross ruts, severely testing front forks and sidecar chassis, were then encountered; but joining the main road at Glyneath, eleven miles from home, enabled a little lost time to be wiped out.

Great credit is due to the Neath officials for the excellent arrangements. The course was marked with blue dye and arrows, which gave universal satisfaction.

Several members of the Carmarthen M.C.C. helped at the checks.

The results were: 1, winner of Challenge Cup, Ivor Thomas (4 Triumph), no marks lost; 2, Jack Thomas (3½ Norton sc.), five marks lost; 3, — Stewart (3½ Sunbeam sc.), nine marks lost.

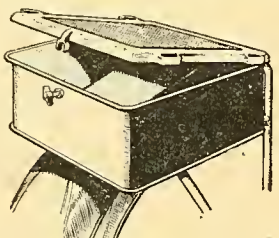
A NON-STOP TRIAL IN FRANCE.



'RENCH motor cyclists will have their first experience of a non-stop test on the 24th inst. in the neighbourod of Paris. When the sporting calenr was drawn up several months ago the nion Motorcycliste reserved this date a touring competition, without, hower, indicating the nature of the event. has now been decided to make this a liability non-stop test, and to hold it on a short course, if possible, about six miles round, somewhere in the neighbourhood of Paris. The course has not yet been decided on, although several places have been examined. The desire of the U.M.F. is to get a set of roads on which there is very little traffic, and which present the maximum difficulties.

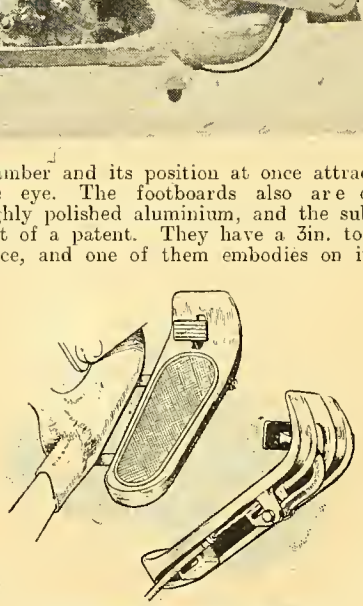
The total distance will be roughly 150 miles, which distance will have to be covered at the average speed of 18½ m.p.h. Although the detailed rules have not yet appeared, it is understood that penalisations will be applied for every stoppage of the engine, whether this should be accidental, in order to carry out mechanical repairs, or by reason of tyre troubles. The only difference is that the number of points deducted will be smaller for tyres than for other causes of stoppage.

A Refined Twin Solo Mount.



The Latest Model of the Massey-Arran Range. Detail Refinements and Exceptional Finish.

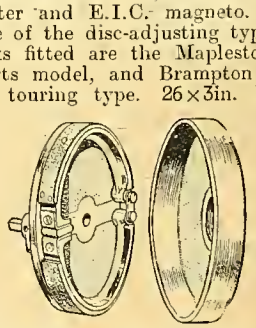
A 5 h.p. sporting model—the new Massey-Arran. The whole design is distinctly pleasing and exceptionally clean.



IN these days when price is such an important factor in the marketing of a new motor cycle, it is interesting to learn that at least one firm retains confidence in that section of the public to whom quality and finish count first. This is the Massey-Arran Co., of Bellbarn Road, Birmingham, whose range of models attracted considerable attention at the last Olympia Show on account of their several refinements.

Recently we were afforded an opportunity of inspecting closely a new 5 h.p. model which embodies features introduced since the Show and illustrated on this page. As will be seen from the large illustration, the 5 h.p. Massey-Arran presents a distinctive and pleasing appearance, due to the fact that it is a designed rather than an assembled machine. The shape of the expansion chamber and its position at once attract the eye. The footboards also are of highly polished aluminium, and the subject of a patent. They have a 3in. toepiece, and one of them embodies on its underside the brake-operating mechanism which brings the pedal into the centre of the plate instead of the more usual position at the side or above it.

The metal tool-box fitted pannier fashion on the carrier.



The brake pedal is operated through the footboard, an unusual innovation.

Another point in connection with this combined footplate and brake mechanism is that it can be fitted on either side of the machine, thus facilitating matters for those partially disabled.

From the pedal the rear brake is operated by heavy Bowden cable, while the brake itself is of the internal expanding type lined with Ferodo.

The engine fitted is the 1921 type 5 h.p. J.A.P., which has a bore and stroke of 70 and 88 mm. respectively, and i equipment includes Amac or B. and carburetter and E.I.C. magneto. Th hubs are of the disc-adjusting type, an the forks fitted are the Maplestone fo the sports model, and Brampton Bifle for the touring type. 26×3in. Dunlo

Rear brake assembly of the Massey-Arran

tyres, Sturmey-Archer gear box, and handsome tank of 2 gals. 1 qt. capacit form part of the equipment.

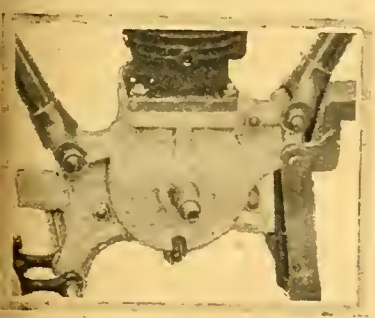
One of the most distinctive features the Massey-Arran is its saddle type too box which takes the place of the carrie It has a polished cast aluminium lid wit pyramid matting to match the foo boards. £145 is the price of eith model solo, and £185 for the sidecar ou fit. £26 extra is charged for Luc dynamo lighting set.

Incidentally, the managing director the Massey-Arran Motor Co. is M Robert W. Vaughan, who for many yea was associated with Canoelet sidecars.

POINTS FOR MOTOR TOURISTS.

A POINT to be borne in mind, particularly by those who are comparatively new to the roads (says *The Autocar*) is that others as well as themselves desire to travel in comfort and safety. The time-worn slogan "Safety First" loses none of its force by iteration, for there are always those who by thoughtlessness, or worse, endanger their fellows. Their rashness, often indulged in with the self-conscious idea of suggesting their own cleverness, may wreck the pleasure of a whole family's holiday. The advice, in this sense, is unnecessary to veterans of the road, but even these need to be always on their guard against the possibility of encountering the man w drives with a disregard for other us of the road. Nor is it alone in the mat of driving that care is needed. The should be carefully looked over bef setting out on tour, so that the risk involuntary stoppage or brake failure m he reduced to a minimum.

NEW MODELS AND NAMES.

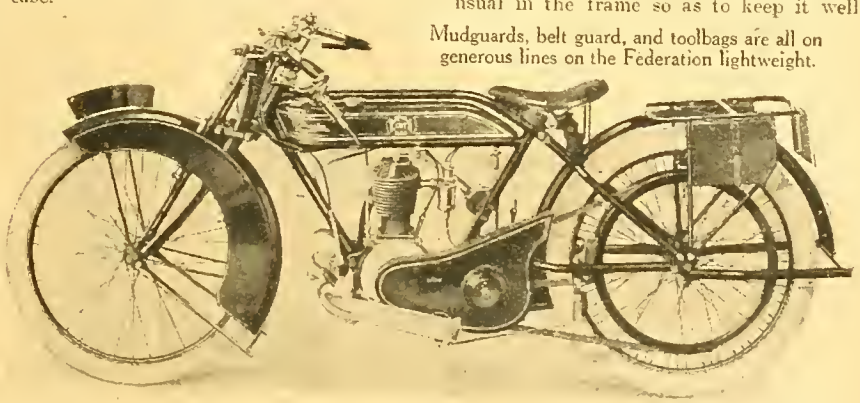


Further Additions to 1921 Lightweights.

Federation and Federal.

ALTHOUGH quite a new machine the Federation is beginning to show up well in Midland competitions. The aim of the makers has been to make a utility weatherproof lightweight while embodying standard and well-tried components. A 2¾ h.p. J.A.P. engine and Sturmey two-speed gear box with clutch and kick-starter are used, while the ample mudguarding, neat chain and belt guard, and very deep toolbags are points that will at once appeal to the average rider. Brampton Biflex forks and a choice of T.T. or touring handle-bars are offered; footboards are standard. This model sells at £84. The makers, the Co-operative Wholesale Society, Ltd., Tyseley, Birmingham, also market a two-stroke Villiers-engined lightweight, which they call the Federal, at £50.

Changes in the Paragon.

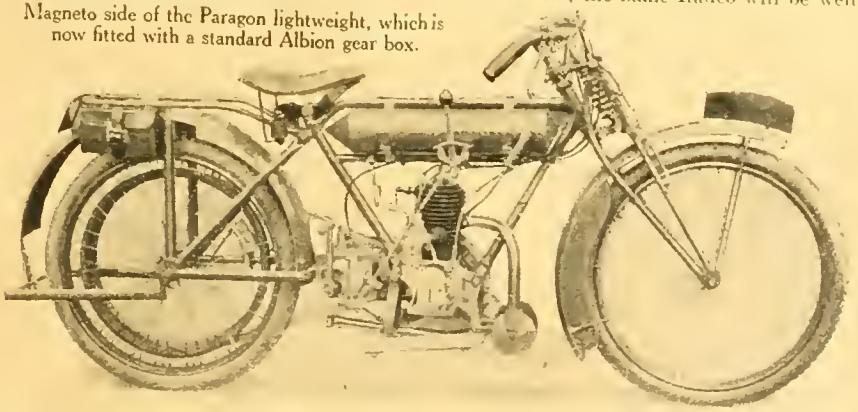


LAST year the Paragon had gear box and engine in one unit, but on the latest model a standard Albion box has been adopted. This mount, however, retains several distinctive points.

Engine plates cast integrally with the crank case on the Paragon two-stroke.

The two-stroke engine of 75 mm. × 79 mm. (349 c.c.) is of the "four-port" variety, having a port in the piston registering with the transfer port, while to this latter a ball valve is fitted, the object of which is to facilitate the separation of the fresh mixture from the burnt gases by scavenging the cylinder by means of an inrush of pure air. Lubrication is by suction from the crank case, the oil passing through a sight drip feed, which is provided with a tap to guard against any leakage when the machine is at rest.

No engine plates are employed for the attachment of the engine to the frame, as lugs are cast integrally with the crank case.

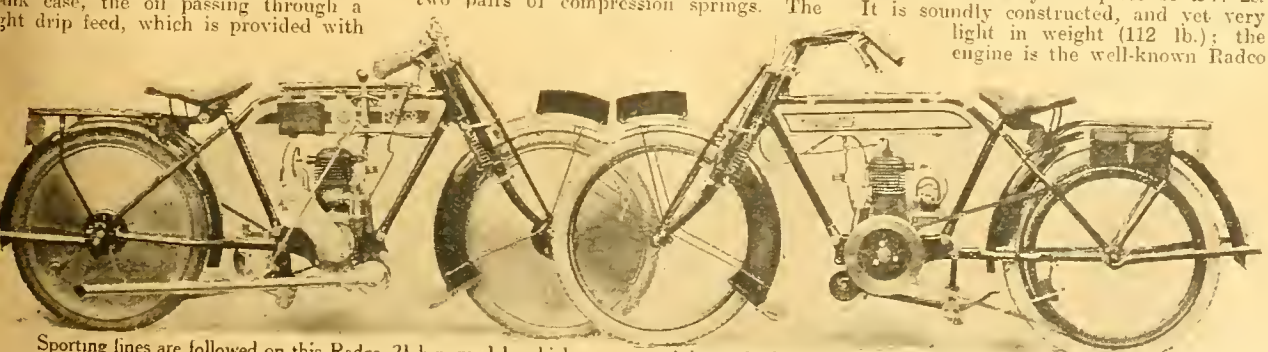


Mudguards, belt guard, and toolbags are all on generous lines on the Federation lightweight.

The C.A.V. magneto is carried on a neat platform attached to the offside of the crank case, and is driven by means of a simple and efficiently designed coupling off the main shaft. A B. and B. carburetter is fitted.

Regarding the spring frame, two vertical tubes run from the rear fork ends and the luggage carrier, and in these are plungers (to which lugs are attached) through which the rear wheel spindle passes. These plungers work against two pairs of compression springs. The front portion of the frame is suspended on Maplestone spring forks.

It must be mentioned that the Albion two-speed gear box, which incorporates a kick-starter, is carried higher than usual in the frame so as to keep it well away from the mud thrown up by the wheels. It is made by the Motor Works, Cressing Road, Braintree, Essex.



Magneto side of the Paragon lightweight, which is now fitted with a standard Albion gear box.

Radco Sporting and Fixed Gear Models.

LONG associated with a leading position in the world of lightweight two-strokes, the name Radco will be well upheld by two models specially prepared for the 1921 market.

The first is a fixed gear model selling at the remarkably low price of £44 2s. It is soundly constructed, and yet very light in weight (112 lb.); the engine is the well-known Radco

Sporting lines are followed on this Radco 2½ h.p. model, which is equipped with disc wheels, knee pads, and rubber grips at an inclusive price.

A low-priced two-stroke machine, the 2¼ h.p. Radco No. 2, sold with fixed gear at forty-two guineas.

New Models and Names.—

unit of 211 c.c. capacity (62×70 mm.) fitted with a chain-driven Fellows magneto situated behind the cylinder on a bracket cast with the crank case. Lubrication is by the petroil system.

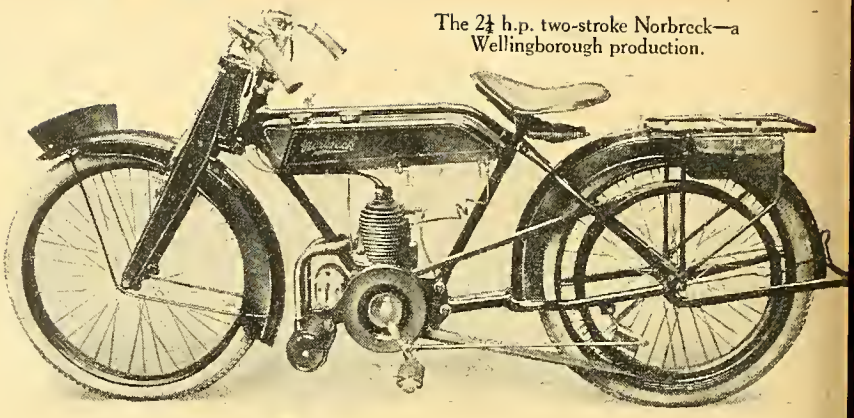
For riders who favour a sporting lay-out the new two-speed disc wheel model at £66 10s. will make a special appeal. In this case the engine has a bore and stroke of 67×70 mm. (247 c.c.), but it follows the general lines of the smaller engine, but has the refinement of the exhaust release being led through a duct in the cylinder casting to the exhaust port. The frame has a pleasing appearance, and very wide back stays are used.

Baron Two and Four-stroke Lightweights.

BLACKBURNE and Villiers-engined lightweights are the two main models made by the Baron Cycle Co., 42-44, Summer Row, Birmingham; these are again sub-divided according to gear box arrangements. The 2¾ h.p. machine may be obtained with an Albion gear box either with or without clutch and kick-starter; in the same way the two-stroke may be fitted with an Albion box or single-geared. Prices range from £52 to £84, and weights from 150 lb. to 205 lb. We should imagine that the latter figure could be brought down five pounds without the makers' assistance. Excellent finish characterises all four models, and the larger machine in particular possesses a very sporting and neat appearance.

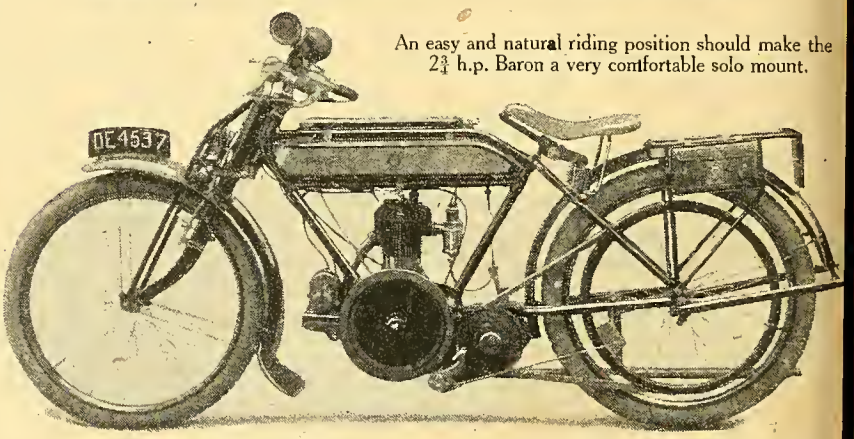
The British Standard.

BRITISH Standard motor cycles are not newcomers, and for 1921 are made in five models: A 2¾ h.p. two-stroke in three types (single gear £53, plain two-speed £60, and clutch and kick-starter £64), a 2¾ h.p. Blackburne with two-speed clutch and kick-starter at £85, and a 4 h.p. Blackburne with Sturmey-Archer three-speed at £118. Brampton forks are used on most of the models, and the tyres on all but the largest machine are 26×2¼in. The saddle height is given as 27in., and the weights of the lightweights are from 135 lb. to 175 lb. The makers are the British Standard, 41, Newtown Row, Birmingham.



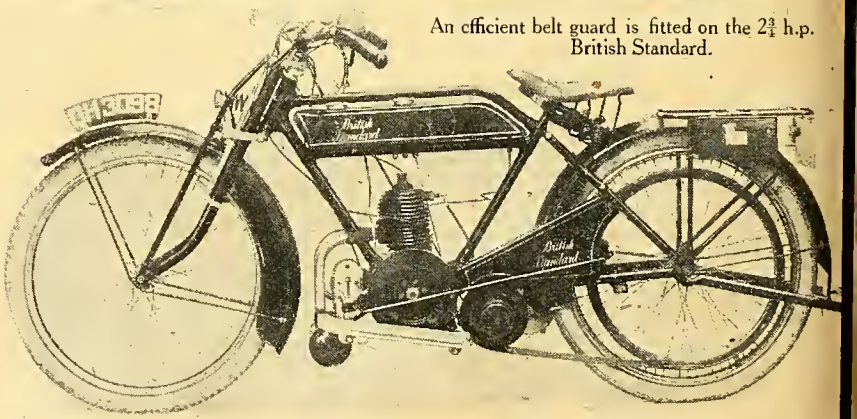
Another New Name.

ALTHOUGH embodying components found on perhaps fifty other makes, there is something about the Pax motor cycle that immediately strikes a distinctive note. Closer examination confirms this impression. For example, the footrests are just where they ought to be, *i.e.*, low down underneath the rider. As may be seen in the picture, a downward extension of the rear engine plate forms a secure housing for the footrest bar. The front engine-plates are continued to the rear to form a cradle for the crank case.

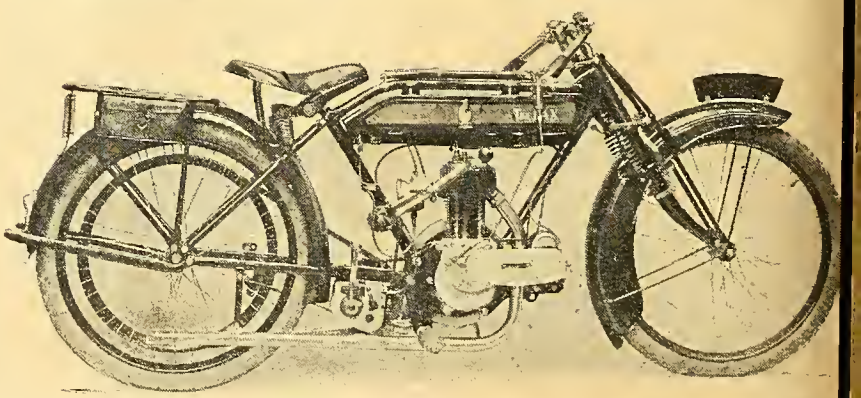


Three models are available—a 4 h.p. Blackburne-engined machine, with a three-speed Sturmey gear box; a 2¾ h.p. Blackburne similarly geared; and, thirdly, a 2¾ h.p. Blackburne model, with a Sturmey two-speed gear box, which comes under the 200 lb. taxation limit.

The address of the Pax Engineering Co. is Station Road, Acock's Green, Birmingham.



The 2¼ h.p. two-stroke Norbreck—a Wellingborough production.



An easy and natural riding position should make the 2¾ h.p. Baron a very comfortable solo mount.

An efficient belt guard is fitted on the 2¾ h.p. British Standard.

Just under the 200 lb. taxation limit—the 2¾ h.p. Pax lightweight.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

AMERICAN V. BRITISH SPEEDS.

Sir,—Regarding Mr. L. W. G. Hartley's explanation of motor cycles attaining higher speeds in America than this country, and the two criticisms of "Gunner" and "D.D.B.B.Sc.," I notice that while both these readers very rightly upset the first theory, neither of them have put forward an alternative one. "D.D.B.B.Sc.'s" remarks, *re* concentrating on high-power engines, rather misses the point, as I believe Mr. Hartley stated that one machine tried in both countries gave a marked difference in speed results. I would suggest that vaporised petrol mixed with damp air would explode less spontaneously than if mixed with dry air, and so cause a slight loss of power. MC 6890.

Rugby.

Sir,—I should like to point out to "Disappointed," who writes in a recent issue of *The Motor Cycle* that, though he may be correct with regard to the relative maximum speeds of the mounts to which he presumably alludes, yet I think he will find that after an average season's mileage the British engine to which he refers will be at its prime, whilst the American will require far more attention to its engine and cycle moving parts. Apart from this, he appears to be exceedingly unlucky in being unable to get more than just over fifty out of his machine. Either it is much below par or his speedometer (unlike most of its kind) lies on the low side. D.M.R.

Oxford.

Sir,—*Re* the correspondence on the above subject in your issue of the 10th inst., I again venture to offer a few criticisms.

The chemical equation quoted by "Chemist" is obviously incorrect; probably a printer's error. It should read:

$$2\ C_6H_6 + 15\ O_2 = 12\ CO_2 + 6\ H_2O.$$

That is to say, two parts by volume of benzene vapour require fifteen parts by volume of oxygen for their complete combustion, or, since the ratio $\frac{\text{air}}{\text{oxygen}}$ by volume is $\frac{100}{21}$, two parts of benzene require 71.4 parts by volume of pure air. Hence, if, as suggested by "Chemist," we take a cylinder containing 1,000 c.c. of pure dry air, we shall require 28 c.c. of benzene vapour for complete combustion, and not 31 c.c., as he states.

Furthermore, on adding the molecular weights in the equation, we find that 156 parts by weight of benzene require 240 parts by weight of oxygen; and since the ratio $\frac{\text{air}}{\text{oxygen}}$ by weight is $\frac{100}{23}$, we find that 156 parts by weight of benzene need 1,041 parts by weight of pure dry air, and not 1,030, as given by "Chemist." As regards his other figures, I must confess I am unable to follow him, and I should be interested to see his method of working.

Personally, I find that at 20° C. a saturated mixture of air and water vapour at normal pressure is capable of sustaining about 2½% of water. Since this water vapour primarily acts merely as a diluent, the effect is to enrich the charge, other things being equal. It has been found that the ratio air/fuel can be varied either way a considerable degree without affecting the maximum power produced. Hence the slight enrichment of the mixture referred to above can have no appreciable effect. A very slight loss may occur through the loss of heat needed to raise the water vapour to the explosion pressure; but it has been found that in some engines the presence of water vapour is actually of service in the production of maximum power.

Regarding the suggestions of "N.S.D.," the average barometric pressure in U.S.A. is nothing like 2in. higher than our own mean pressure. Probably 0.75in. is nearer the mark. This would correspond to a gain in power of about 3.8%. The fact that aeroplanes make their greatest speed at low levels is due not only to the better volumetric efficiency of the engine, but also to the fact that the propeller functions more efficiently, with less slip, in the denser medium.

Altitude, as met with on roads in this country can have no appreciable effect on the power produced by the average motor cycle engine—two-stroke or otherwise. Even on roads 1,500 feet above sea level only about 2½% loss would occur.

Lastly, the fact that the air on the tracks in America is hotter than in this country would operate *against* any increase of power, but not to any appreciable extent.

Croydon. D.D.B.

HOW LONG DOES THE OIL LAST?

Sir,—After reading the various comments *re* naked driving chains, I thought a little tip would not be out of the way for some of your contributors. Simply fix an ordinary paint brush on to a clip from some suitable part of the frame, allowing the brush to rest on the chain with a slight pressure. This in use keeps the chain quite clean, free from grit and mud. All that is necessary is a few squirts of oil on the brush from time to time. HENRY EVANS.

Cardiff.

THE PERSONAL ELEMENT IN TRIALS.

Sir,—The time is now here when manufacturers and certain well-to-do private owners will be furbishing up their mounts ready for the various reliability trials. From this a question arises, particularly as regards trade entries, another, namely, who does more to win the "gold," rider or machine?

It is, I think, correct to assume that trade teams are entered solely for advertisement purposes, and that the machines are ridden by men who are experts both in the art of competition riding and the use of the internal combustion engines. These men are, generally speaking, capable of winning a premier award on almost any make.

If one follows the reports of the various A.C.U. trials, one will notice that no sooner has a particular make of machine secured a "gold" than its manufacturer booms this fact for all it is worth as proving the reliability of his product; but was it the machine or the rider? In other words, if this same machine had been ridden by an average motor cyclist, would it have performed the same doughty deeds? I think not. Yet it is to these average motor cyclists that the vast majority of sales are made, and to whom the advertisements are addressed, and who, no doubt, feel a certain sense of disappointment when their machines fail to climb some hill on which they were advertised as having gained "bonus marks."

Should any manufacturer be bold enough to allow and advertise the fact that his machines were to be ridden by men culled from the ranks of the average motor cyclists—men unknown to the regular trials riders—I am certain that the public, as representing prospective buyers, would take a far greater interest. BASIL S. ANDERSON.

Something unusual in war memorials. A 15in. shell in the tiny Gloucestershire village of Weston-sub-Edge. It is not the only one of its kind in the smaller villages. The machine in the foreground is a Scott, with Henderson spring-framed sidecar.

CANDID CRITICISM.

Sir,—As a fairly constant reader of your paper, and one who has owned a large number of motor cycles during the last fourteen years, I hope you will allow me to make a few remarks on my latest purchase.

Towards the end of last year I purchased one of the "best" twin-cylinder sidecar outfits, the price of which, with dynamo lighting, was nearly £250. I had never owned a machine of this make before, and decided to purchase because of the exceedingly good reputation and second-hand value of this particular outfit.

I felt that, having paid what, I think, is obviously an absurd price, I might reasonably expect a first-class article. The following notes are, I think, a fair comment on what I actually got:

Distance covered, 1,000 miles, mostly town work. Time in my possession, nine weeks.

ENGINE.—This gave no trouble whatever, with the exception of sticky valves. It was over-oiled and required decarbonising.

CARBURETTER.—Single lever. This proved very convenient for traffic. Petrol consumption, about 60 m.p.g. The starting was bad, and on cold, misty days the throttle piston froze up. Obviously, there should have been some heating device.

MAGNETO.—No trouble.

LUBRICATION.—Simple hand pump.

INJECTING TAPS.—These were very bad. No "off" stop was fitted, and quite frequently one found petrol dripping on to the cylinders.

GEAR BOX.—This worked well; but the operating mechanism was poor. The gears were noisy. The engine chain was, as usual, adjusted by sliding the gear box. Very awkward. Since improved, I believe, by using a screw arrangement. Surely this was an obvious necessity from the beginning.

CLUTCH.—Hand-controlled. Quite good; but too "heavy."

CHAINS AND CASES.—Usual adjustments necessary, and the cases ensured the chains always running in a mud-oil mixture. Lubricating plugs fitted to the cases, with instructions to "Oil every day." Why not fit proper lubricators?

BRAKES.—Rear, internal expanding. Usual front farce. The brake was excellent as far as stopping the wheel was concerned; but almost useless for stopping the outfit, except on perfectly dry roads. Why not an interconnected sidecar brake? The Rover used to have one. Mine worked well.

WHEELS.—Detachable. Never used them. The usual trouble with hub races. Are these ever up to the work? By way of assistance, no tool was provided for adjusting.

SPRING FORKS.—These were the worst I have ever had, except on another machine fitted with the same pattern. They are misnamed "spring." They simply do not, except sideways! There are, I think, ten places to oil, only two of which are fitted with lubricators. The other places are simply holes filled up with paint.

SPRING SEAT-PILLAR.—This worked quite as well as the spring forks. I weigh about 12 st.

STEERING HEAD.—Adjusted twice.

CONTROLS GENERALLY.—The designer must have loved Bowden wire. There were six separate "wires," each adjustable, and nothing in the tool-kit smaller than a full size King Dick, and it was not even a genuine one.

TOOL-KIT.—Scandalous; the finishing touch being a push bicycle 3½d. tin oil-can.

SIDECAR.—This was comfortable; but the finish was poor, and the quality of the material worse. The attachment to the machine was at three points, and very flexible. Cornering was accordingly unpleasant. The springing was good. Instructions say lubricate the spring "shackles," but there are no lubricators!

ENAMELLING (GENERAL).—Atrocious. It came off—where there was anything to come—in sheets.

PLATING.—This was as bad as only motor cycle plating can be. Fortunately, there was not much of it; but why any?

ACCESSIBILITY.—Why, when a machine has been developed for years for sidecar work, and is generally sold with one fitted, should the chains be *both* on the near side?

Now, my object in writing is to show that in 1920 one of the best outfits on the market was in many ways wanting, and that there is room for real and necessary improvement without going in for over-refinement. There are elementary faults to be rectified.

I think that, if one excepts the development of the gear box, the A.B.C. is the only machine which shows any material advance in design on a 1907 single. Of course, the A.B.C. has faults, but it has the following advantages:

1. Great comfort.
2. Excellent torque and engine balance.
3. Beautiful gear change.
4. Mechanism neatly arranged.
5. Protection from mud.
6. Sensible finish.

Is there any other machine of which the same may be said? There is no need for manufacturers to be original. Mr. Bradshaw has saved them the trouble. Give us an A.B.C. without its faults. C. H. STEPHENSON.

FOR THE ODD CORNERS.

Sir,—I examined with profound admiration the photograph of the unusually equipped Harley-Davidson sidecar outfit appearing in your issue of February 3rd. However, it would appear that the compass can be of little use, as its reading will be rendered extremely inaccurate by the presence of steel in immediate proximity. To be of any real use, it should be enclosed in a magnetic screen. After such a promising beginning, I am somewhat surprised that the owner has omitted many other useful, nay indispensable, instruments. For example, as a suggestion, I would say, a theodolite, having both an altitude and azimuth circle; a sextant; and perhaps, as a luxury, a spectroscope. For these his passenger would possess the means, whilst her escort is changing a sooted plug, of delving lightly into the sciences of astrophysics, have the inexpressible pleasure of watching the antics of the asteroids and "cœlum empyreum," or, alternatively, possess the wherewithal of indulging in geodetic operations. E.W.G.

Chester.

AN UNCOMMON TROUBLE.

Sir,—I should like to encroach upon a little of your valuable space in order to inform your readers of a very peculiar and deceptive trouble which overtook me late one evening last summer.

I was returning from Birmingham on a single geared, clutchless machine when the power suddenly fell off in an alarming manner. With throttle fully open I bumped along at about 4 m.p.h. There was no sign of misfiring and no unusual noise from the engine, except that the exhaust denoted that it was labouring heavily. Naturally, I immediately stopped and made an examination of my machine, but this left me no wiser, for the engine seemed perfectly free, and I knew that the lubrication was not stinted in any way. I let it cool and essayed another start. When I dropped the exhaust the engine fired twice and then stopped dead. I found there was a good spark at the plug, and that the carburetter was in perfect order.

Again I tried to start, and again the engine fired twice only. Just as I was conjuring up visions of a long push my eye rested on the pulley, which appeared to be slightly loose on its shaft. I removed it and found the cause of my trouble.

The pulley screwed on to a right-hand thread on the shaft, and the locking nut screwed on to a left-hand thread. The pulley was prevented from screwing up too far by a gun-metal washer abutting on a shoulder on the shaft. This washer had become compressed, and when the engine fired the pulley screwed up till it touched the crank case and thus acted as a powerful brake. When I ran the bicycle to start, the pulley, of course, unscrewed as far as the lock nut, and the engine seemed quite free, but after two explosions the pulley reached the crank case and stopped the engine. I got home by packing up the washer with another one.

Coventry. CONK.

DISADVANTAGES OF DISCS—SOLO.

Sir,—In several numbers of your excellent journal lately I have read letters from various aspirants to the honour of having discovered disc wheels. In my humble opinion they should be only too anxious to hide their lights under bushels. The first disc-wheeled machine I rode was a racing Rudge. While riding at a reasonable speed down the Queensferry-Edinburgh road a chance gust caused me to try conclusions with a wall, with which this road is nearly all bounded. I lost a good deal of skin and temper, and many gadgets from the bars. This year my fancy was taken by a 2¾ h.p. J.A.P.-engined machine. Discs of a peculiar malignant order were the only drawback to this really fine machine. I bought the machine determining to remove the discs forthwith. In a week or so I did this; in the interval having nearly crashed on several occasions on exposed roads. The removal of the discs I will pass over lightly. The rear one was inextricably entangled with belt rim and spokes. When at last I had the wheel clear of the offending things, I found five broken spokes in the front wheel and seven behind. All the others on the outside of the hub rim were worn thin. This necessitated rebuilding both wheels. I accounted for this by reasoning that when a bumpy road was encountered the spokes whipped and the discs chafed over them, not because the discs were loose. They were not. Also I had to renew the wheel bearings. The hub oilers were quite unreachable with discs.

Wheels of the Michelin detachable type now supplied for cars are admirable, of course. They are easy to clean and have no spokes to break. For a four or three-wheeled machine a pressed steel disc wheel is the real goods. I think the only soloists who have discs nowadays and enjoy them are the enthusiasts with baby two-strokes, long exhaust, and T.T. bars. For me, I cannot afford insurance premiums, and if I want to sail before the wind I take my disc-less machine down to Brighton and hire a dinghy.

Rudgwick. G.A.W.

OVERSIZE TYRES.

Sir,—The letters referring to 3in. tyres on the Cleveland have roused me to make a few remarks.

I have long felt that the majority of motor cycles are undertyred. My present mount, a Triumph and sidecar, excellent in most respects, has tyres which are barely large enough for solo work, and absurd for sidecaring. I am going to try 28×3in. tyres, but I am afraid the rims are too narrow to support the big tyres satisfactorily.

I cannot see what advantage is gained by fitting tyres smaller than 26×2½in. to even the lightest machines, in view of your readers' remarks about the Cleveland.

All this leads us to another point. We have recently been given new standard rim sizes. An excellent thing to have them standardised, but why the multiplicity of sizes? I am informed that the new standard 26×3in. rim (C.C.1) will take four sizes of tyres, viz., 26×3in., 27×3½in., 650×65 mm., and 700×80 mm. I found it hard to believe, and have not verified it, but I am assured that it is so.

Then why have any other size of rim? Even if the millimetre sizes will not fit—and on the face of it one would imagine that they would not—the Cleveland shows that 26×3in. is not too large for a lightweight, and 27×3½in. is apparently big enough for the Henderson, which, I believe, is this year the heaviest and most powerful machine on the British market.

A great advantage of having only one size of rim would be that dealers would not have to carry such large stocks; and even if a garage were out of one size, a traveller stranded with a bad burst could fit any other of the above four sizes. In conclusion, will someone who has tried both say how 26×3in. tyres compare with 28×2½in.? and if 27×3½in. tyres are better than 28×3in.? Would 26×4in. be better still! F. A. LEWIS.

SUMMARY OF CORRESPONDENCE.

"LO 1871" does not agree with "Insurance Man's" suggestion, in a recent letter, that it is often advisable to bear one's self the first £2 10s. or £5 claim on a policy. He describes his own experiences of the difficulties attending the settlement of a small claim.

Several letters touching on the British and American speeds controversy continue to reach us. "J.C.D.," for example, quite reasonably asks an explanation of the contradiction between "Chemist's" theory and the claims of various devices for *damping* the mixture to obtain an increase of power.

"Biz" draws attention to the similarity of the Wooler gear to the under-geared countershaft mount that "Ixion" recently referred to.

"Somerset" echoes the question recently asked by a reader as to why there are, so often, no prices given in displayed advertisements.

An echo of the London-Land's End run reaches us from a Taunton correspondent signing himself "Another Norton." He complains somewhat bitterly, but with justification, of two bad instances of "swanking," and consequent hanlking, on Porlock by non-competing riders of a Henderson and a Norton.

Mr. C. E. Hubbard has had the unusual experience of being told by his insurance company that his burnt sidecar outfit was *underinsured*. This generous company, who paid up the full amount and handed over the salvage as well, is the North and South Insurance Corporation, 1, Albemarle Street, London, W.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	Book post.
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition	2 -	2/3
"TRACING MOTOR CYCLE TROUBLES." A system for tracing motor cycle faults and of remedying them when found. Fourth Edition ..	2/-	2/3
"MAGNETOS." By A. P. YOUNG. A complete treatise on magneto ignition for motor cars, motor cycles, and aeroplanes. Second Edition	4/6	4/10
"TWO-STROKE MOTOR CYCLES." A reliable treatise on Two-strokes, from the rider's point of view. Just published	3/-	3/3
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle*	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS, England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District ..	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

CLUB NEWS.

Forthcoming Club Events.

April 9.—Ivy M.C.C. (Wolverhampton). Club Run.
April 9.—West Birmingham M.C.C. Captain's Run.
April 9.—Ilkeston and District M.C.C. Club Run.
April 9.—North Lindsay A.C. Hill-climb.
April 9.—Bournemouth and District M.C. and L.C.C. Social Evening.
April 9.—Wolverhampton M.C.C. Reliability Trial.
April 9.—Surbiton and District M.C.C. Dale Cup Trial.
April 9.—Kidderminster M.C.C. Paperchase.
April 9.—North London M.C.C. Petrol Consumption Test.
April 9.—Dewsbury and District M.C.C. Competition and Picnic.
April 9.—Leeds and District M.C. Knock-out Hill-climb.
April 10.—Portsmouth and District M.C. and L.C.C. Club Run.
April 10.—Halifax and District M.C.C. Somerville Reliability Trial.
April 10.—Northern M.C. Social Run.
April 10.—Berwick and District M.C. Non-stop Trial.
April 10.—Sheffield M.C.C. Club Run.
April 10.—West Kent M.C. Club Run.
April 10.—Harrogate and District M.C.C. Social Run.
April 10.—Banbury and District M.C.C. Opening Run.
April 13.—Reigate, Redhill, and District M.C.C. Petrol Consumption Trial.

IMPORTANT club and OPEN events are tabulated on the "Questions and Replies" page.

Chorlton-cum-Hardy M.C.C.

Mr. Dudley R. Hardy, 5, Edge Lane, Chorlton-cum-Hardy, is the hon. secretary of a new club in this neighbourhood.

Marlow and District M.C.C.

At Easter the club spent the week-end at Bournemouth, and had an extremely enjoyable time. It is hoped to repeat the run later on in the season.

North-west London M.C.C.

A challenge cup has been presented by the vice-presidents (Messrs. Williams, F. Thomas, and Pooley) to be awarded to the most successful lady competitor in club competitions each year.

Sheffield M.C.C.

Entries for a sporting reliability trial on the 16th April must reach the secretary, Mr. C. E. Henderson, 22, Wales Road, Upperthorpe, Sheffield, by the 14th April. Entry fees are only 6d.

Weston-super-Mare and District M.C.C.

Another meeting of this club, which was formally started a fortnight ago, was held on the 4th inst., at the Elm Tree Hotel. Mr. D. Read, Orchard Street, is the hon. secretary.

Wallington and District M.C. and L.C.C.

On Saturday, the 16th inst., the club is holding a reliability trial over a fifty-mile course in Surrey, starting from the Triangle, Wallington, and finishing at Burford Bridge. This is open only to members, and entries close on April 9th.

Eastern Valley M.C.C.

Fine weather favoured the opening run on Good Friday, and quite a number of enthusiasts left the Clarence Hotel at 11 a.m. and travelled *via* Usk and Raglan to Monmouth. After lunch, the party went on to Tintern.

Redditch and District M.C.C.

The opening event in connection with this club will be a flexibility trial on Saturday, April 9th, starting at 3 p.m. Five classes have been arranged for motor cycles and one for four-wheelers of any make or power. Full particulars may be obtained from the hon. secretary, Mr. P. C. English, Easemore Road, Redditch.

Herts M.C. and L.C.C.

The opening rally of this newly formed club has been fixed for April 9th, at the Bridgewater Arms, Little Gaddesdon, near Berkhampstead, Herts. Members will "go as they please," and are urged to bring friends; all motor cyclists will be cordially welcomed. Tea will be at 4.30, and will be followed by a concert in the lounge.

Doncaster and District M.C.C.

On Easter Monday a speed-judging contest on the Great North Road resulted as follows: 1, A. Moate (4 Triumph sc.), 89%; 2, C. W. T. Clarke (4 Blackburne), 84%; 3, H. Christian (2¾ Douglas), 83%.

One hundred and twenty members and friends spent a most enjoyable evening at the annual dance on April 1st.

Dorchester M.C. and L.C.C.

Major J. Gundry, J.P., the president, took the chair at a well-attended general meeting; it was decided to hold the opening run on April 7th to Lyme Regis.

Skipton and District M.C. and L.C.C.

Although only formed four weeks ago, there are now over sixty members on the books. Headquarters have been secured at the Black Horse Hotel. Runs took place on Good Friday to Richmond, and Easter Monday to Wetherby. Application for membership should be made to the secretary, Mr. J. Wilkinson, 10, Granville Street, Skipton.

Beith and District M.C.C.

All particulars of this new Ayrshire club may be obtained from the hon. secretary, Mr. John L. Cochram, 24, The Cross, Beith.

North Cheshire M.C.C.

Starting from the Trafford Hotel, Alderley Edge, the opening run was held on the 3rd inst. Mr. H. Broderick, Somerby, Winslow, is the secretary of this club.

Northern M.C.

On Easter Monday there was a social run, and many of the club members journeyed to Kendal to witness the hill-climb organised by the Westmorland Motor Club.

Central London M.C.C.

With the object chiefly of catering for the social side of the pastime a club has been formed for those resident right in the Metropolis. The hon. secretary is Mr. Marcel Clement, 19, Sicilian Avenue, London, W.2.

Worcester and District M.C.C.

At the headquarters a further interesting series of lectures was delivered on the 21st March by Mr. D. S. F. Rayner, who very kindly consented to come from the Birmingham University to lecture on the Diesel engine.

Buxton and District M.C.

At a meeting attended by a representative number of motorists on Monday, March 21st, it was decided to form a motor club with the above title. Mr Herbert Frood was elected president, with Mr. T. B. Harrison as hon. sec. and Mr. G. F. Harlow as assistant hon. sec.

In spite of the heavy downpour at the Stockport Open Hill-climb, quite a big crowd gathered. J. V. Prestwich (2¼ h.p. J.A.P.) starting in the 250 c.c. solo class

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

BELT SLIP.

Can you assist me to prevent belt slip in rain on a single-geared direct drive two-stroke lightweight? I have written to the makers of my present machine who tell me that I should have no trouble in wet weather, and that the belt slip is due to slack belt, greasy belt, or worn pulley. This is not the case, and motoring acquaintances state that it is due to the small pulley, and is a common fault with machines of this type. I have possessed several similar machines and have always had the same trouble. The machines have always refused to mount an ordinary hill in rain. Is there any cure, partial or complete?—W.W.

Provided the belt is reasonably tight, it should not slip unduly. We would suggest that you fit an under shield and front guard to prevent water splashing on to the belt.

BALANCING A TWIN.

A 5-6 h.p. Precision twin which I have vibrates very badly at speeds above 20 m.p.h. I have often cured this on aero engines by carburetter adjustment, but can do nothing on this one. I have rigged up a special stand with rods for balancing flywheels, and by taking just half the reciprocating masses, which is 2¼ lb., and hanging them the other side of the shaft, I can make these flywheels stop anywhere. I should say it is impossible to balance a 50° twin with only 1½in. throw on the crank, as the width of two pistons and weight of reciprocating masses overhang, with the result that they bind. Can you suggest another way of balancing by dismantling the flywheels and connecting rods? This engine has a fork and floating bush. What difference would it make if I drilled a ½in. hole right through the flywheels?—H.C.

We are rather at a loss to understand exactly your trouble. The usual method of balancing a twin engine is to take the weight of one piston and connecting rod, plus the weight of big ends, crank pin, and its bearings, and balance this by an equal weight directly opposite the crank pin and at the same mean radius, *i.e.*, rotating masses plus half reciprocating masses. From your description, this appears to have been done already. Later research, however, tends to show that with connecting rods of average motor cycle length (as compared with length of stroke) the balance weight should more nearly approach rotating masses plus .6 of the reciprocating parts.

FAILURE TO RESTART.

Will you kindly give me your advice in getting my old pattern Bradbury motor cycle to run properly? I have the exhaust valve timed as follows: Valve closes when the piston reaches top centre, and the spark occurs when the piston is on top of the compression stroke. When trying it the engine fires vigorously for about 200 yards, and then stops suddenly, and is bad to start again, and sometimes cannot be restarted until the engine is quite cold. The compression is very good, and there is no stoppage in the petrol supply. The carburetter appears to be in good condition. I have also fitted a stronger inlet valve spring (it is automatic). There is always a good fat spark.—H.S.H.

If the engine will start and continue to run for 200 yards there is apparently only some slight defect which prevents it continuing to do so. This may be either an obstruction in the petrol supply, or it may be caused by the sparking plug becoming overheated. You say that the spark occurs when the piston is on the top of the compression stroke, but you do not say whether this is with the control fully advanced or fully retarded. As a matter of fact, this timing is correct only if the ignition control is two-thirds retarded. It would be advisable to notice whether the exhaust valve stretches when heated, after running a short distance, as if the tappet clearance is very small this may prevent the valve closing.

BUILDING A CYCLE CAR.

Having decided to try building a lightweight cycle car, I am wondering if it is possible to use a 2¾ h.p. two-stroke engine for driving a two-seater. My idea is a tandem-seater no wider than a sidecar; with engine in front, and belt drive on to two back wheels, or single belt drive on to live back axle. I should use a wood chassis covered with either aluminium or canvas. The only thing I am in doubt about is the steering. I should like your opinion of the cable and bobbin. Is it a practical arrangement? If two cables are used together, I think it should prove safe against any likely failure of steering gear. Do you consider a three-wheeler would be safe with a track 3ft. wide and about 7ft. long?—G.A.G.

A small three or four-wheeler might be propelled by a 2¾ h.p. two-stroke engine, but you would not find its climbing abilities very great. Probably such a vehicle can be constructed so as to weigh less than the average sidecar outfit, especially if you use a light wooden chassis with canvas covering, on aeroplane lines. The cable and bobbin system is quite satisfactory on a very light vehicle, and is used with success. A four-wheeler would be much more simple to design and build. A track of 3ft., with wheelbase of 7ft., would be satisfactory in a small four-wheeler, but the track would need to be considerably wider, for safety, with a three-wheeler.

Although there have been many detractors of sidecar taxis, these handy machines are definitely taking their place among public hire vehicles. Here is a fleet of B.S.A. Canoelet outfits supplied by the County Cycle and Motor Co. to Col. H. Hoskins, Brighton, one of many owners who are confident of a bright future for the sidecar taxi.

TIMING AND TAPPET CLEARANCE.

Could you please let me know the valve clearances and timing of a 5-6 h.p. Harley-Davidson single-cylinder 1916 model?—W.S.

The tappet clearances should be about $\frac{4}{1000}$ths when warm, and you can time the engine as follows: Rotate the shaft until the piston reaches the top dead centre, and insert the cam wheels so that the exhaust valve is just closing and the inlet just commencing to open. You can then disregard the opening points of the exhaust valve and the closing point of the inlet valve.

THE JUGGERNAUT.

Recently I sustained an accident, and am anxious to have your advice, and to know whether you think I could prosecute successfully. I was driving a motor cycle and sidecar in the direction of the Great North Road, at a place where there was a fair amount of traffic. I was well on my own side of the road as was all other traffic, but when within about, say, thirty or forty yards of an oncoming cyclist, he, for some unknown reason, fell. A char-à-banc was about the same distance behind him, as I was, and as I came up to where the cyclist was (now picking himself up and just about to withdraw his bicycle), the char-à-banc swerved on to his wrong side of the road in order to avoid the cyclist, with the result that to avoid a collision I left the road for the green alongside; but this was rough and uneven, and a mound brought me to a standstill, reversed my direction, and slowly turned the outfit over, throwing my passenger out and pinning me beneath. Fortunately no serious personal damage was done, and to the best of my knowledge nothing beyond a badly buckled wheel, torn apron, bent toolbags, etc., resulted to the machine. However, I feel that I ought not even to bear the expense of these repairs, but naturally do not want to pay law cost in addition. I fully expected the char-à-banc (being a following vehicle) would pull up. Is not this the recognised law? The char-à-banc proprietors disclaim all responsibilities, but I must say it was in no way due to care on their driver's part that he did not hit me (had I not adopted the course I did I fear I should not now be asking your advice). I have two favourable witnesses; of course the char-à-banc proprietors may take the attitude that I lost my head and left the road unnecessarily; they maintain there was ample room.—H.T.B.

While it is of course impossible to state definitely that you will succeed, we think that you have every justification for instituting proceedings against the proprietors of the char-à-banc. We presume that the cyclist was on his own side of the road when he fell, and as the char-à-banc was overtaking him it was the driver's duty to stop, as you on your own side of the road coming in the opposite direction clearly had the right of way.

EXPERIENCES WANTED.

"P.S." (Paris).—Model K Henderson.

"R.H.C." (Farnborough).—Any type of English carburetter on 7-9 h.p. Harley.

RECOMMENDED ROUTES

WREXHAM TO KING'S LYNN.—T.R.V.

Wrexham, Bangor, Whitchurch, Fernhill, Market Drayton, Broughton, Eccleshall, Stone, Uttoxeter, Sudbury, Derby, Spondon, Borrowash, Nottingham, Bingham, Bottesford, Grantham, Somerby, Corby, Edenham, Bourne, Spalding, Holbeach, Long Sutton, King's Lynn.

SWANLEY JUNCTION TO CHESHAM.—C.H.H.

Swanley Junction, St. Mary Cray, Orpington, Locks Bottom, West Wickham Common, Addington, Coombe Lane Station, Waddon Station, Wallington, Carshalton, Sutton, Cheam, Cheam Common, Worcester Park Station, New Malden, Norbiton Church, Kingston-on-Thames, Hampton Court, Hampton, Sunbury Common, Staines, Windsor, Eton, Salthill, Farnham Royal, Farnham Common, Beaconsfield, Amersham, Chesham. Approximately 58½ miles.

PLUMSTEAD TO RUGBY.—W.E.P.

Plumstead, Woolwich, Woolwich Manorway, East Ham Manorway, Aldersbrook Road, Wanstead High Street, Snaresbrook, Woodford Green, Chingford Green, South Street (Ponders End), Enfield Town Station, Chase Farm Station, Potters Bar, South Mimms Church, St. Albans, Redbourn, Markyate, Dunstable, Hockliffe, Woburn, Newport Pagnell, Gayhurst Stoke Goldington, Hackleton, Northampton, Harlestone, West Haddon, Chirk, Rugby. Approximately 95 miles.

Important Dates.

Fri., April 8th, and Sat., April 9th—Western Centre A.C.U. Two-day Open Trial.

Sat., April 16th—Yorkshire Centre A.C.U. Open Hill-climb at Sutton Bank

Sat., April 23rd—Midland Centre A.C.U Open Reliability Trial.

Wed., April 27th—A.C.U One-day Trial

Fri., April 29th, and Sat., April 30th—Ealing and District M.C.C. London-Holyhead Open Reliability Trial.

Sat., April 30th—Newcastle and District M.C. Travers Challenge Trophy Open Reliability Trial.

Sat., April 30th—Surbiton and District M.C.C. Open Inter-Team Trial (Private Owners only).

Fri., May 13th, and Sat., May 14th—M.C.C. London-Edinburgh Run.

Sat., May 21st—Western Centre A.C.U. Open Hill Climb.

Wed., May 25th—A.C.U. Silencer Trial at Brooklands.

Sat., May 28th—East Midland Centre A.C.U. Open Hill Climb.

Tues., June 14th—Junior T.T. Race

Thurs. June 16th—Senior T.T. Race.

Sat., June 25th—M.C.C Inter-team Trial for "The Motor Cycle" Cup

Sat., July 2nd—Bournemouth M.C.C. Open Reliability Trial.

Sat., July 9th—St. Andrews Speed Trials

Mon., July 11th, to Sat., July 16th—Scottish Six Days' Trial.

Wed., July 6th, and Thurs., July 7th—Arbuthnot Trophy Trial.

Sun., July 24th—Motor Cycle Grand Prix Race in France.

Mon., Aug. 1st, to Sat., Aug. 6th—International Six Days Trial in Switzerland.

Mon., Aug. 29th, to Sat., Sept 3rd—A.C.U. Six Days Trial.

Sat., Sept. 17th—Grand Prix Race for Cycle Cars.

SPARKLETS

Tyre Price Reduction.

Following many recent examples the makers of Beldam tyres are reducing their prices by 20%.

New Scale Prices.

An all-round reduction of the prices of New Scale machines is announced by Roberts and Hibbs, of Droylsden, Manchester. The 4 h.p. (Blackburne) model is reduced from £126 to £100, and the 3½ h.p. two-stroke from £94 10s. to £80. Sidecar models from £160 to £133 and £123 to £108 respectively.

Chain Knowledge.

All owners of chain-driven machines should write to Brampton Bros., Ltd., Oliver Street, Birmingham, for "Chat on Chain," an invaluable little handbook on the correct use of chain transmission on motor cycles; it is undoubtedly one of the most useful trade pamphlets we have seen.

A New Gloucester Agency.

That well-known motor cyclist and competition rider, W. B. Gibb, has recently greatly improved his premises at 100, Northgate Street, Gloucester, where he carries on a highly successful motor cycle agency. An amusing handbill announcing the change has reached us, in which Mr. Gibb says that his "only reason for opening new premises is to see what on earth will happen next"!

Catalogues Received.

Jenson and Nicholson, Ltd., Stratford, London, E.15: A re-issue of the instructional leaflet dealing with the re-enamelling of motor cycles and sidecars by means of Robbialac preparations.

Wessex Garage Co., Ltd., Exeter. A well-produced little booklet describing machines for which the company holds agencies, written in an entertaining and discursive way.

The Wulfruna Engineering Co., Ltd., Great Brickkiln Street, Wolverhampton. Describing the various Wolf motor cycles: Model D with the 4 h.p. Blackburne engine, Model A with the 2¾ h.p. Blackburne engine, Model B the two-stroke two-speed gear model with Villiers engine, and Model C the 2¾ h.p. J.A.P. engined model.

The J.E.S. Motor Works, Gloucester. Booklet devoted to the J.E.S. 2 h.p. two-stroke motor cycle; one of the lightest machines made (88 lb.), and occupying a unique position on the British market. It is a thoroughly well designed and well made motor cycle in miniature.

H. Reed and Co., Ellesmere Street, Hulme, Manchester: A catalogue of the complete range of Dot motor cycles. One of the most interesting of these is the 3½ h.p. twin sporting model, which weighs under 200 lb., thus bringing it within the lightweight tax. A certificate is attached to every machine when leaving the works, giving the correct weight unladen.

CURRENT HAT

Times to Light Lamps.

Inter-'Varsity Speed Trials.

Oxford and Cambridge will hold an inter-'Varsity speed event on Harling Common, near Thetford, on May 1st.

Police Motor Cycle Night Patrol.

Armed plain clothes police on motor cycles are said to be scouring the country roads at night around London in search of farm incendiaries.

The English Bridge, Shrewsbury.

The Borough Council of Shrewsbury has recently made a byelaw preventing vehicles overtaking one another on the bridge which is situated on the main Holyhead road entering Shrewsbury from London. This byelaw has been necessitated by the narrowness of the roadway, the steepness of the incline to the crest of the bridge, and the large amount of traffic passing over it. The Borough Council earnestly enjoins all motorists strictly to observe the terms of the byelaw.

British Motor Cycles in Italy.

Road racing is very popular in Italy just now, and we are able to announce further successes for British machines, this time in the Circuit of Cicagna. The 1,000 c.c. class was won by Vernoni Nino on an 8 h.p. New Imperial. A Scott won the 750 c.c. class.

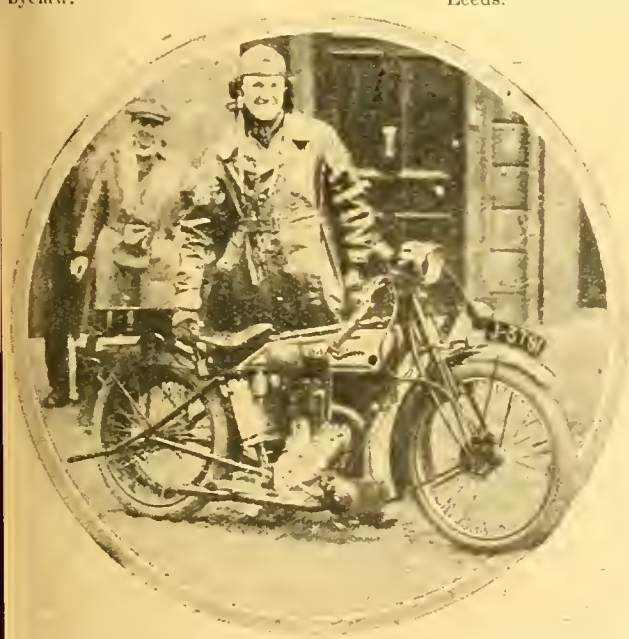
Argenteuil Hill-climb.

Argenteuil hill-climb, near Paris, which has not been run since the war, will be revived on the 10th inst. The hill is about one and a half miles in length, and has one sharp and one easy bend. This event, which is organised by the Moto Club of France, is open to all classes of motor cycles, as well as scooters and cycle cars.

Inter-University Speed Trials.

The officials of the Leeds University M.C.C. are anxious to organise a speed trial this year which shall be open to the members of any university motor cycle club. The use of a suitable course within five miles of Leeds has been offered, and the event should be a successful one if the necessary support is forthcoming. Secretaries of eligible clubs should write to Mr. B. Boynton, University M.C.C., Leeds.

Special Features.



IS AIR-COOLING ADEQUATE?
ROAD TESTS OF NEW MODELS.
FOUR DAYS ON THE ROAD.

A New Radial-engined Motor Cycle.

The British Radial Engine Co. have bought the manufacturing rights of the Redrup radial-engined motor cycles, and will manufacture these machines at their works at Lacland Place, 429b, King's Road, Chelsea, London, S.W.10.

Spring Number of "The Autocar."

Our parent journal *The Autocar* will next week publish a Special Spring Number and Illustrated Buyers' Guide of cars on the British market. So many price reductions have occurred since the Olympia Show that a modern guide to prices will prove particularly useful at this juncture. This issue of *The Autocar*, dated April 16th, will be considerably enlarged, and contain many special articles and illustrations of absorbing interest. Motor cyclists interested in four-wheelers of any kind will be well advised to place a definite order with a newsagent for a copy of *The Autocar* Spring Number.

PAINSTAKING RIDERS REWARDED.

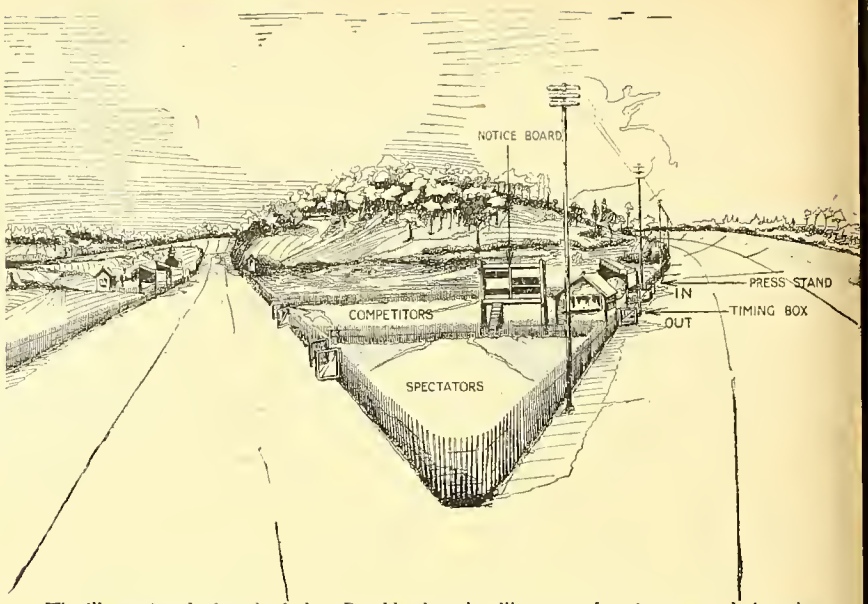
Out of 1,100 machines at the annual Richmond (Yorks) Good Friday meeting, G. Dawson (1916 3½ Rudge) received the Mayor's prize for the best kept machine. The other picture shows the judges deciding to award *The Motor Cycle* prize, for the most ingenious amateur improvement, to C. Cockran (8 Clyno sc.), who had fitted a most complete tool drawer on his luggage grid.

CII

B.M.C.R.C. First Open Meeting.

A very interesting programme is being arranged for the first open meeting of the British Motor Cycle Racing Club to be held on Brooklands Track on Saturday, May 7th. Cars, cycle cars, and motor cycles will each be provided for, and the provisional programme drawn up by the committee promises an excellent day's sport.

Death of a Two-stroke Pioneer.



The death of Mr. W. Murphy on Friday morning last as the result of a sidecar collision is an event which is recorded with regret. Mr. Murphy was a pioneer of the motor cycle two-stroke engine, especially devoting himself to large capacity singles. For many years he has had a 500 c.c. machine running as a sidecar mount with great success.

Northern Centre, A.C.U.

A meeting of the various clubs in Cumberland and Westmorland which form the Northern A.C.U. Centre was held last week-end. Several hundred motor cyclists attended, and after Mr. S. Rutherford explained the objects of the centre it was unanimously resolved to proceed with the formation of the centre. Mr. J. Morton, jun., Warwick Road, Carlisle, has been elected secretary.

Improvements at Brooklands.

Alterations to Brooklands Track are contemplated by the British Motor Cycle Racing Club. These will include a new motor cycle paddock at the Fork, where most of the B.M.C.R.C. races start and finish, a new judges' and timekeepers' box, a special press stand, notice boards, etc. Mr. A. V. Ebblewhite has been elected chairman, and Mr. A. G. Reynolds vice-chairman, for the ensuing year.

The illustration depicts the fork at Brooklands as it will appear after the proposed alterations planned to improve facilities for spectators at motor cycle events.

Further Price Reductions.

We are able to announce that Messrs. Lea and Francis, following the general trend, have made a substantial reduction of £20 on both their 3½ h.p. and 5 h.p. models. The price of the former is now £125, and the latter £145.

90 m.p.g. WITH SMALL FOUR-WHEELERS.

EXCELLENT weather conditions prevailed on the occasion of the Junior Car Club's fuel consumption trial on Saturday last. Several of the vehicles entered were of the type with which many readers of this journal are interested, and their performances are well worthy of record. It must, however, be borne in mind that in a trial of this kind the method of driving employed is by no means normal, the driver usually starving his carburetter and engine so that the best fuel consumption results are obtained, and driving in a manner which no one would attempt under normal circumstances.

The trial started from Stanmore Station, where all the cycle cars had their tanks filled right up to the brim. The course was a triangular one—through Stanmore, up the Edgware-St. Albans road, up Brockley Hill, and through Elstree and Radlett, along the narrow undulating and winding road to St. Stephens on the outskirts of St. Albans, and then to Watford, Rickmansworth, up the somewhat steep Betchworth Hill after the latter town, then down to Norwood, and back to Stanmore.

The road from Watford to Northwood and beyond was bad and dusty.

Two of the G.N.'s distinguished themselves. Mundy's tied with one of the Deemsters in covering the course with most miles to the gallon to its credit—90.6 m.p.g. and 55.3 ton-miles to the gallon, while the Hon. V. A. Bruce's cycle car of this make did 89 m.p.g. and 55.4 ton-miles to the gallon.

C 2

SUTTON COLDFIELD A.C. DINNER.

ON Friday last, under the chairmanship of Mr. T. Allday, a most successful dinner was held by the above club. Some seventy members and guests were present on this occasion, which was the eighth annual dinner of the club. Valuable trophies, including the Colmore Cup, were presented after dinner by Mrs. Allday, and an excellent amateur musical programme was enjoyed. Mr. G. F. Pearson (Mayor of Sutton Coldfield) was present, and many well-known faces in the motor cycle world were to be seen.

The Colmore Cup Trial was the first open trial ever held, and, in spite of the fact that the 1921 event was not open, has become a classic, always drawing very large entries. The Sutton Coldfield Club was one of the earliest organisations to encourage lightweight machines. One speaker urged that similar encouragement should be given to cleanly motor cycles, and it is not improbable that both these desirable types will receive the club's very special attention in the future. Undoubtedly the president, officials, and members of the Sutton Coldfield Club are to be congratulated on their far-sighted policy and their excellent organisation.

SECOND-HAND MACHINES AT THE CRYSTAL PALACE.

THE immense popularity of the motor cycle, as evidenced by the apparent reluctance of owners to offer their machines for sale, was the first thing to strike the visitor on Saturday last, when the Second-hand Car and Motor Cycle Show at the Crystal Palace was thrown open to the public. Three hours after the doors were opened there were but sixteen exhibits staged in the motor cycle section, but we were informed that a good many more were undergoing the road trial and examination to which all machines were subjected by Mr. Rex Mundy before they could be placed on sale.

It is not perhaps generally known that exhibits may be accepted up to Saturday next. The entry fees are 5% on the first £40 on motor bicycles and on the first £60 on sidecar outfits, the balance being 1¼%.

WESTERN M.C.C., GLASGOW.

THE result of the Spring Holiday Trial reflects the severity of the road and weather conditions during the event. Out of thirty-four starters who left Glasgow on the Saturday, only nine survived to the end of the trial, and less than half of these qualified for gold medals. The results are as follows:

Mrs. Duncan Bell (7 A.J.S. sc.) wins the A.J.S. Trophy and gold medal.
W. Morton (3½ James), the Hutchinson Trophy and gold medal.
J. Lilliewood (6 A.J.S. sc.), gold medal and special prize for private owner and club member
D. Q. Bell (7 A.J.S. sc.), gold medal.
Murdoch Frazer (7 A.J.S. sc.), silver medal.
W. Pethybridge (A.B.C. light car), silver medal.
Allen Neilston (7 A.J.S. sc.), bronze medal.
R. J. MacEwan (Richardson light car), bronze medal.
R. M. Wilson (2¾ Hobart), bronze medal.

The Western Centre Two Day Trial.

DESPITE the fact that officially the trade is not supporting the event, just one hundred entries have been received for the A.C.U. Western Centre Two Day Open Trial. This event is due to start to-morrow (Friday), but at the time of going to press it is not certain what effect the coal strike will have upon road trials of this nature.

In *The Motor Cycle* of March 24th (page 383) we published a detailed map of the course showing observed hills; therefore, now we need only recapitulate the chief points of interest *en route*.

Timetable.

FIRST DAY.—Start Hereford control 8.30 a.m., Bronllys check 9.54 a.m., Upper Chapel check 10.45 a.m., Builth Wells 11.6 a.m., Rhayader check 11.45 a.m., Devil's Bridge control (arrive) 12.45 p.m., Devil's Bridge control (depart) 2.15 p.m., Machynlleth check 3.35 p.m., Llanidloes check 4.35 p.m., Aberystwyth control (arrive) 6.6 p.m.

SECOND DAY.—Aberystwyth control (depart) 8.30 a.m., Llanrhystyd 8.57 a.m., Lampeter (quarter mile outside) 9.37 a.m., Llangybi check 9.51 a.m., Pumpsaint 10.23 a.m., Cynghordy Post Office check 11.0 a.m., Builth Wells 11.59 a.m., Llandrindod control (arrive) 12.21 p.m., Llandrindod control (depart) 1.51 p.m., Builth Wells 2.13 p.m., Brecon check 3.5 p.m., Beaufort 3.57 p.m., Gilwern check 4.12 p.m., Hay check 5.18 p.m., Hereford control (finish) 6.33 p.m.

Times at foot of observed hills:

FIRST DAY.—Mynydd Eppynt 10.49 a.m., Plinlimmon 3.55 p.m.

SECOND DAY.—Llangybi 9.52 a.m., Sarn Helen 9.55 a.m., Caio 10.27 a.m., Llanddewfi Cwm 2.20 p.m., Black Rock 3.37 p.m., Tre Fadoc 5.22 p.m.

Below is given a list of competitors:

HIGH SPEEDS ON KOP HILL.

165 Entries in the Essex M.C. Hill-climb near Princes Risborough.

H. Thorpe at speed on a 3½ h.p. Sports Model Douglas.

WERE records for hills easily recorded, and always authenticated, there is no doubt that previous best times for Kop hill would have proved well beaten on Saturday. The event was the open hill-climb of the Essex M.C., and glorious weather and a large entry, including a positive galaxy of experts, combined to produce very keen riding.

T. C. De la Hay who made fastest time of the day on an overhead valve 3½ h.p. Sunbeam. This machine recently put up some phenomenal performances.

Never has it been our pleasure to witness more expeditious organisation in a hill-climb. Synchronised watches and a field telephone allowed one competitor to be despatched before the man in front was much more than half way up the hill. Therefore the 165 entries and nineteen events in the motor cycle and three-wheeled cycle car class passed off with lightning-like rapidity.

Sidecar Classes First

The two sidecar classes started the ball rolling, and some very fine ascents by Riddock (8 Zenith sc.), O'Sullivan (7-9 Harley-Davidson sc.), and E. A. Bridgman (7-9 Indian sc.), were made in the 1,000 c.c. class.

Some very fast lightweights were in evidence in the next two classes. G. S. Davidson (2½ Levis) was unfortunate in stopping for some unexplained reason on the top bend: thus the Diamonds and New Imperials had things almost all their own way. Newey (on a Levis), however, made a very fast ascent in the open 250 c.c. class.

Things began to hum when the 500 c.c. machines came along, and it was evident that it was going to be a close tussle between De la Hay's Sunbeam, Thorpe's Sporting Douglas, and H. Petty's and G. A. Vandervell's Nortons. The Sunbeam was afterwards disqualified in all the "touring" classes; it was the new overhead-valved machine with which De la Hay will defend his T.T. title. Petty did well to make fastest time in his class on his first ascent of the hill.

Vandervell, who rode in a hair-raising manner, and who was later successful in piloting a Talbot car up in under 39s., took the honours in the class for 750 c.c. machines.

In the unlimited touring class, Le Vack's Indian and Riddock's Zenith had

The light four-wheelers made very steady and fast climbs. W. F. Davenport (A.V.) overhauling A. Knight on an old type Carden.

High Speeds at Kop Hill—

a close tussle. Le Vack got it, however, in the very fine time of 32.4s.

Classes F and G were for *any* motor cycle, and thus De la Hay's Sunbeam was eligible. His ascent in Class F at 30.4s. stands as fastest time of the day. In Class G, however, his engine was "missing," and honours again went to Le Vack.

CLASS A.—TOURING SOLO NOT EXCEEDING 250 C.C.

Event 1 (Open). On Formula.—1, J. V. Prestwich (2½ Diamond-Jap); 2, J. Lidstone (2¼ James); 3, Kaye Don (2½ Diamond-Jap). Fastest time: H. Newey (2¼ Levis).

Event 2 (Members). On Formula.—1, J. V. Prestwich (2½ Diamond-Jap); 2, J. Lidstone (2¼ James); 3, Kaye Don (2½ Diamond-Jap). Fastest time: J. V. Prestwich (2½ Diamond-Jap).

CLASS B.—TOURING SOLO MACHINES NOT EXCEEDING 350 C.C.

Event 3 (Open). On Time.—1, Albert E. Swan (2¾ New Imperial-Jap), 47.8s.

Event 4 (Members). On Time.—1, J. V. Prestwich (2½ Diamond-Jap), 49.6s.

CLASS C.—TOURING SOLO MACHINES NOT EXCEEDING 500 C.C.

Event 5 (Open). On Time.—1, H. Petty (3½ Norton), 36.4s.

Event 6 (Members). On Time.—1, H. Petty (3½ Norton), 36.4s.

CLASS D.—TOURING SOLO MACHINES NOT EXCEEDING 750 C.C.

Event 7 (Open). On Time (formula results not verified yet).—1, G. A. Vandervell (3½ Norton) and G. Strange (3½ James) tied, 38.4s.

Event 8 (Members).—1, G. A. Vandervell (3½ Norton) and G. Strange (3½ James) tied, 38.4s.

CLASS E.—TOURING SOLO MACHINES NOT EXCEEDING 1,000 C.C.

Event 9 (Open). On Formula.—1, G. S. Davison (2½ Levis); 2, G. A. Vandervell (3½ Norton); 3, H. Thorpe (3½ Douglas). Fastest time: H. le Vack (7-9 Indian), 32.4s.

Event 10 (Members). On Formula.—1, G. A. Vandervell (3½ Norton); 2, H. Thorpe (3½ Douglas); 3, G. Strange (3½ James). Fastest time: H. le Vack (7-9 Indian), 32.4s.

CLASS F.—ANY SOLO MACHINES NOT EXCEEDING 500 C.C.

Event 11 (Open). On Time.—1, T. C. de la Hay (3½ Sunbeam), 30.4s.

Event 12 (Members). On Time.—1, T. C. de la Hay (3½ Sunbeam), 30.4s.

CLASS G.—ANY SOLO MACHINES NOT EXCEEDING 1,000 C.C.

Event 13 (Open). On Time.—1, H. le Vack (7-9 Indian), 33s.

Event 14 (Members). On Time.—1, H. le Vack (7-9 Indian), 33s.

CLASS H.—TOURING PASSENGER MACHINES NOT EXCEEDING 500 C.C.

Event 15 (Open).—1, R. C. Chawner (3½ Sunbeam sc.), 71.4s. Walk-over.

Event 16 (Members).—No runners.

CLASS J.—TOURING PASSENGER MACHINES NOT EXCEEDING 1,000 C.C.

Event 17 (Open). On Time.—1, J. P. Riddock (8 Zenith sc.), 44s.

Event 18 (Members). On Time.—1, J. P. Riddock (8 Zenith sc.), 44s.

CLASS K.—TOURING THREE-WHEELED CYCLE CARS NOT EXCEEDING 1,110 C.C.

Event 19 (Open). On Time.—1, E. B. Ware (10 Morgan), 45.6s.

Event 20 (Members). On Time.—1, E. B. Ware (10 Morgan), 45.6s.

LONDON-LAND'S END RESULTS.

Four Premier Awards won by a 3½ h.p. Ariel, a 7 h.p. A.J.S. Sidecar, a 10 h.p. Morgan, and a 12 h.p. A.B.C. Car respectively.

72 motor bicycles started, 56 finished, 37 gold medals, 14 silver medals, 2 disqualified, 2 no award, 1 held over.
60 sidecars started, 44 finished, 25 gold medals, 13 silver medals, 6 disqualified.
8 three-wheel runabouts started, 5 finished, 4 gold medals, 1 silver medal.
56 cars started, 42 finished, 23 gold medals, 16 silver medals. (See "The Autocar.")

PREMIER AWARDS.

JARROTT CUP: 1.—F. A. Longman (3½ Ariel), time on Porlock 9 min. 0 1/5 sec.
2.—P. W. Moffatt (3½ Douglas), 8 min. 59 1/5 sec.
3.—F. W. Applebee (2¼ Levis), 9 min. 1 sec.

CAPTAIN'S CUP for best performance by a sidecar: 1.—F. W. Giles (7 A.J.S. sc.), 9 min. 1 4/5 sec.
2.—A. P. McGowran (4 Triumph sc.), 9 min. 2 3/5 sec.

ELCE CUP for three-wheeled cycle cars: S. A. McCarthy (10 Morgan), 9 min. 3 sec.

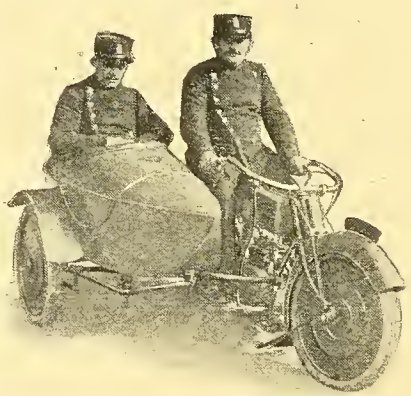
MOTOR CYCLES FOR POLICE WORK.

The Advantages of the Modern Motor-Cycle appreciated by Scotland Yard.

Sidecar Outfits to be used in Metropolitan Area.



At Los Angeles, in California, as in the majority of American cities, a large force of motor cycle police is maintained. The illustration depicts the plain clothes section.

THE Commissioner of Metropolitan Police has decided more extensively to employ motor cycles for the control of traffic. This fact has been eagerly seized by the daily press as material for startling headlines.

"Scorchers to be Chased" was one eye-compelling headline, and in the context one found that Fleet Street's conception of the duties of such a force will be to give chase to offenders against the speed limit.

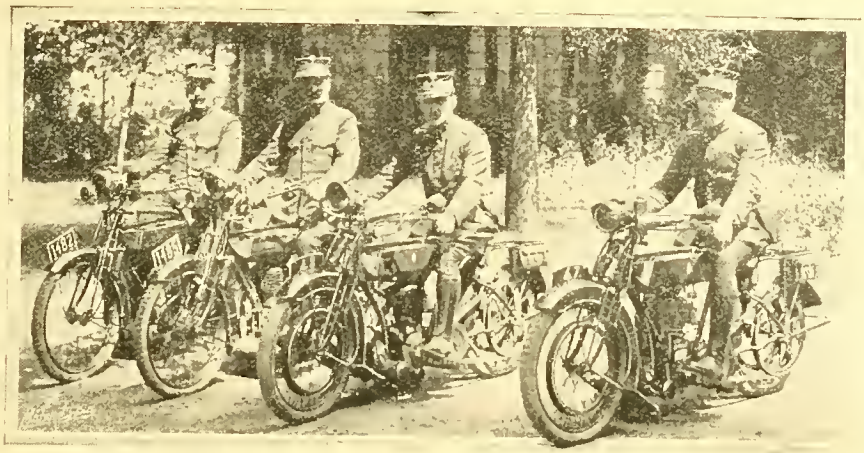
Cinema Stunts.

Those of our readers who are cinema-goers know how such methods work in America. A motorist in a hurry after the "heavy lead" passes a motor cyclist policeman who promptly sets off in pursuit. After an exciting chase, during which the lives of innocent pedestrians are in jeopardy, the 7-9 h.p. Indian or Harley draws ahead and the offender is brought to a stop, sometimes at the point of a revolver. This is not actually what happens in the land of freedom; nevertheless, almost every city in U.S.A. employs large squads of motor cycle police, and the lot of the speedman is not altogether a happy one. In addition to motor cycle patrols many cities have a corps of plain clothes officers who mingle with the traffic, and, so it is contended, are not above tempting motor cyclists for a speed burst in order to obtain a "case."

The Paris police authorities long ago realised the necessity of the motor cycle in upholding the law.

Not for Chasing Purposes.

Probably our Fleet Street journalists had taken the U.S.A. police as a pattern when making guesses at the duties of the officers forming the London squad; but, from an interview we had with the authorities at Scotland Yard, we can say that they guessed wrong. At present, at all events, there is no intention of utilising the motor cycle police for chasing motor cyclists whose rear lamps have jolted out, or those who are suspected of exceeding the speed limit. In all probability the speed limit will be sufficiently increased to render such patrols unnecessary by the time the new squad has completed its experiments, which lie in an entirely different direction from that suggested by the daily papers.



A motor cycle squad of the Sultan of Egypt's Police with their Douglas mounts.

Traffic Regulation.

Ten Triumph-Gloria outfits are to be put into commission, and they will be sent out with two officers each to assist in regulating traffic as necessity arises. Chiefly their duties will be on main arteries where a large amount of traffic is expected, such as on Derby Day and similar events which attract to one point an extraordinary number of vehicles.

Everything considered, the British police have been tardy in adapting modern motor cycles to their use, and we have many times urged the authorities to give consideration to

the undoubted advantages of such machines for many duties. Almost every progressive country in the world has its motor cycle police force, and the illustrations given on this and the preceding page depict men in the police forces of Egypt, Belgium, France, Canada, and U.S.A.

The Belgian Motor Cycle Police shown mounted on British machines—James and B.S.A.

In Liverpool the police have realised the value of the motor cycle, and only recently we gave an illustration of the Beardmore-Precision mounted men in the Liverpool force. Brighton, too, has sufficient motor cyclists in the police to muster a squad when needed, and on many recent royal visits to the provinces motor cycle specials have acted as escort to the royal carriage, and so proved their utility.

We feel sure that the Metropolitan Police will find their new venture an asset to their organisation, and we expect before long to see the motor cycle section of the force very considerably extended.

The smart and serviceable uniform of the officers of the Regina Police, Canada, is of special interest.

Uniformed New York Police. A squad ready for special parade duty.

CLUB NEWS. (Continued from page 434.)

Leeds and District M.C.

There was an excellent muster of members for the run to Burnsall on the 3rd inst. An *al fresco* picnic on the riverside was enjoyed by all.

Bedford and District M.C.

For the Pater, Holland, Rhodes, and Hebblewaite prizes a petrol consumption test, held on Easter Monday, resulted as follows: Class B.—C. F. Plowman. Class C.—Miss L. Luddington. Class D.—N. M. Bligh. Class E.—A. Bristowe.

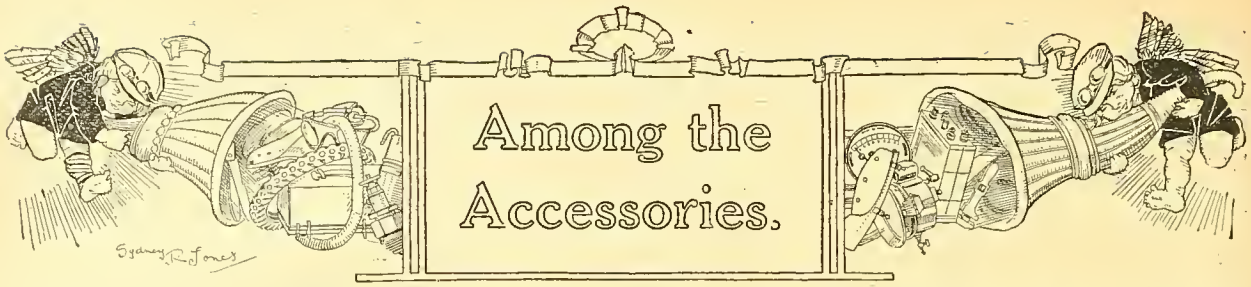
North-west London M.C.C.

On Sunday last the official opening run took place starting from Hampstead Heath, through St. Albans, and the lesser known Hertford lanes to Hemel Hempstead and Iving hoe for lunch, forty members sharing the meal. Members of the party then organised an impromptu hill-climb, the object being the summit of Iving hoe Beacon by the "direct" route over the grass. Tea at Little Gaddesdon, and a saunter home in the delightful spring evening, completed a most enjoyable day.

Stockport and District M.C.

All the classes that were uncompleted in the open hill-climb on the 12th ult. will be run off on April 16th.

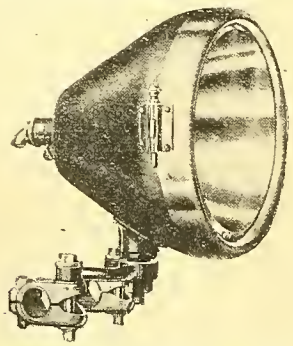
Eastern Centre A.C.U.



At the Blue Boar Hotel, Cambridge, on Wednesday, March 23rd, a meeting was held for the purpose of forming an Eastern local centre, and the following clubs have made application to the A.C.U. to form this centre: The Cambridge and County M.C.C., the Eastern Counties M.C.C., the Essex Motor Club, the Ipswich and District M.C.C., the Norfolk M.C. and Light Car Club, the Southend-on-Sea and District A.C., and the Romford and District M.C.C. In addition, several other clubs have expressed a desire to belong to the centre. The following officers were elected: President, Mr. H. H. Burrows (Southend); chairman, Mr. E. J. Bass (Essex); vice-chairmen, Messrs. W. W. R. Spelman (Norfolk) and T. Bunnet (Cambs.); and hon. treasurer, Mr. H. S. Wallis (Cambs.). The hon. secretary is Mr. Douglas Stuart, Algers Road, Loughton.

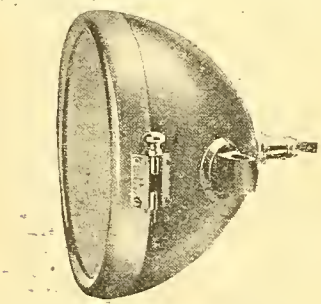
East Lancs M.C.C.

Eighteen members competed for the Hornby Cup on Good Friday over a course through Slaidburn, Buckhaw Brow, and Ingleton, then returning to Ribchester. Results: H. Walsh (3½ Scott), winner of cup; W. H. Shuttleworth (3 A.B.C.) and R. Jacks (3½ Norton), certificates.



Worcester and District M.C.C. and Worcestershire M.C.

The club held its official opening run on the 3rd inst. to the British Camp Hotel, Malvern. Here the members were joined by contingents of the Bristol, Gloucester, Cheltenham, Stourbridge, and Malvern motor cycle clubs. There was a right royal turnout, the number of vehicles totalling nearly three hundred, amongst which was noticeable a large number of new mounts. The feeling of friendship existing between the clubs named, which all belong with others to the A.C.U. Western Centre, was very marked. After tea some impromptu hill-climbing took place up the sheep tracks on the Malvern hills.



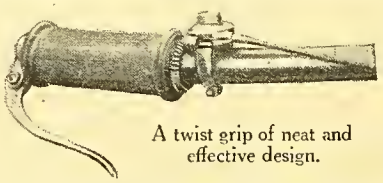
Two New C.A.V. Head Lamps.

FEW firms have been more successful in the construction of powerful electric head lamps than Messrs. C. A. Vandervell and Co., Ltd., Acton, London, W.3, who are, perhaps, the pioneer automobile electric lighting firm.

Model E.C. head lamp, complete with central pillar handle-bar fittings, sold by Messrs. C. B. Vandervell, of Acton.

Model E C, the smaller of the two lamps illustrated, has a 5¾in. glass, and is supplied complete with central pillar bracket fixing and clip. The method of fixing is highly substantial, and should be very satisfactory. It is intended to be run on six volts.

A 6¾in. electric head lamp by Messrs. C. B. Vandervell.



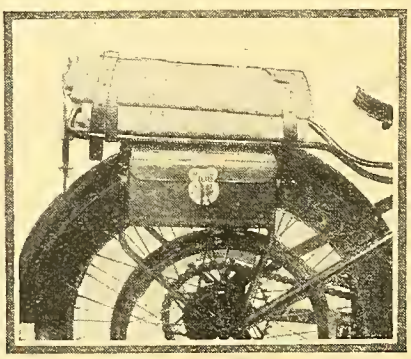
The D H model, of which the front glass is 6¾in. across, having been primarily intended for head lights on cycle cars, makes a very excellent super lamp for those who require particularly good illumination. It should, therefore, be suitable for the heavier type of side-car outfit. It is built on the same principle as the C.A.V. car head lights. It is also intended to carry six volt bulbs.

Both lamps are excellently made, and present a very handsome and clean appearance.

C22

Twist Grips for British Motor Cycles.

WHATEVER the disadvantages of twist grip control, centainly it shows a great advantage in wintry weather, when thick gloves impede the operation of small levers, or thinly clad fingers are numbed with the cold. The grips illustrated have been made and patented by Mr. George Cumming, 19, Rose Street, Aberdeen, who retains Bowden wires. We understand that a 125° movement has been found the best for touring work. As will be seen by the illustration, the device is exceptionally neat.



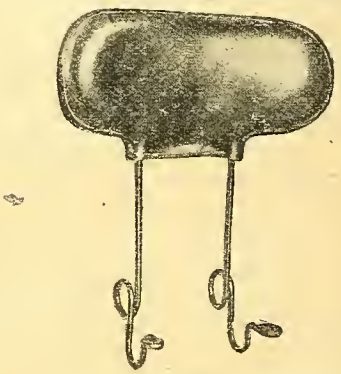
A twist grip of neat and effective design.

A "Garage" on the Carrier.

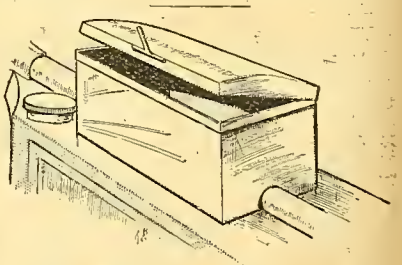
SINCE we last referred to the Howard motor cycle cover it has undergone one small but important improvement. In the forward portion are eyelets which enable a rustproof chain to be inserted through the cover, over the front wheel, and round the forks, and allowing the padlock to remain outside. Thus a considerable obstacle is placed in the way of a thief who wishes to steal either the cover or the motor cycle, or both.

For those who are undertaking long journeys where garage room is difficult to obtain, this motor cycle cover, in conjunction with a lock, renders it perfectly safe if it is wished to leave the machine in the open at night.

Folded up on the carrier, the Howard cover makes a good pillion cushion.



The cover is made by the Howard Car and Cycle Cover Co., 71, High Holborn, London, W.C.1.



The Howard motor cycle cover.

A Useful Backrest.

THERE is little doubt that on long journeys a support for the back is extremely welcome. A simple form of back rest is illustrated. The rest can be easily attached by being fastened by the screws underneath the saddle and has lately been placed on the market by Messrs. James Grose, Ltd., 4, Old Jewry, London, E.C.1.

A backrest produced by Messrs. Jas. Grose, Ltd.

Designed to carry tools in the most protected position — an aluminium top-rail tool-box sold at 20/- by Reg. Samson, Ladywood Road, Birmingham.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

CARRIAGE EXTRA IN EACH CASE.
DEFERRED PAYMENTS ARRANGED.

SPECIFICATION.

Engine, "DOUGLAS" horizontal twin cylinder, all worn parts discarded, rebuilt with new parts where necessary, fully tested before reassembling.
Gear Box, 2¾ h.p., with two speeds and free position, 4 h.p. with three speeds, kick-start and clutch, rebuilt as new.
Carburetter, new, two lever AMAC, with plated handle-bar controls.
Magneto, new, C.A.V. or Thomson-Bennett, with plated handle-bar controls.
Frame, Forks, Wheels, and Mudguards, Etc., either new or thoroughly renovated, and stove enamelled in best finish.
The Tank is thoroughly renovated as new, and finished in "DOUGLAS" colours, aluminium and blue panels, with "DOUGLAS" transfer, and new plated fittings.
Tyres, new, 26in. × 2¾in. heavy covers and tubes.
Handle-bars, newly nickel-plated in best style, 2¾ h.p. semi T.T., 4 h.p. standard touring pattern.
Induction Pipe, Fork Springs, Gear Lever, Etc., either new or newly nickel-plated.
Saddle, new, or renovated as new.
Front Brake, Belt, Chain, Etc., Etc., brand new.

Each of the above machines is rebuilt in our own extensive up-to-date works with a great proportion of new parts. In appearance they are almost indistinguishable from new, and we are prepared to give a signed guarantee with each machine. We are in the best position in the trade to give satisfaction with our rebuilt machines, being closely associated with the private syndicate which purchased the whole of the surplus W.D. motor cycles from the Slough Trading Co., and having always a tremendous stock of new "DOUGLAS" parts.

Delivery from stock. Trade supplied.

Special quotations on application for TRIUMPH and P. & M. Motor Cycles rebuilt as above.

"DAYBEAM" Electric Solo Set

The Headlamp supplied with this set is our 5in. Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

Complete Outfit, List No. 30/1, Price £5 5. 0
(If tail lamp is not required, deduct 12/6).

"DAYBEAM" Combination Set

Write for List No. VI.

The set comprises Daybeam 5in. Headlamp, fdeal Sidecar Lamp, and Torpedo S.B.C Tail Lamp. Each lamp is fitted with an independent switch, and is finished in ebony black with nickel-plated relief. The Accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting and will give very satisfactory service in use. Many have now been in use two or three years, and are as efficient as when first purchased. **All our Accumulators are specially made to stand vibration.** Ordinary accumulators are never satisfactory for motor cycle work. The hard wood case supplied with this set is finished ebony black, and is specially treated to withstand acid. This outfit is despatched completely assembled with bulbs and all necessary wiring, etc.

Complete Outfit, List No. 30/2, £7 7 0.

"DAYBEAM" LIGHT CAR SETS
(Particulars on request).

The Transport Crisis.

AS we go to press the nation is faced with a crisis such as has never before confronted the country. Once more the Government appeals to patriotic motor cyclists to give assistance in the interests of the community, and we know that the large number of motor cyclists required in the event of a suspension of ordinary forms of transport will be forthcoming.

Both the A.C.U. and the A.A. are inviting motor cyclists to offer their services immediately, and, no doubt, by the time these words appear in print, the emergency organisations of the respective bodies will be in a position to advise the Government that loyal assistance of thousands of motor cyclists may be relied upon.

Both drivers and vehicles are required, and motor cyclists are asked to register with either the A.A. or the A.C.U., offering their services and the use of their machines in order that the community may not lack food and other necessaries, and to help the authorities to maintain an adequate road transport service for these purposes.

If the occasion arises, there will be one more opportunity to demonstrate to the Government and the country at large the great utilitarian value of the motor cycle, and we know that British motor cycles and British motor cyclists will again prove their worth as they have done in the past.

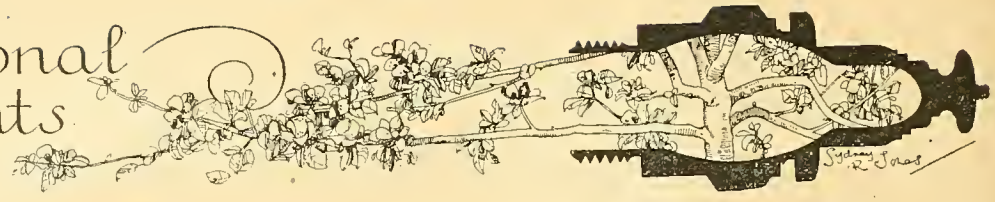
186,000 Motor Cycles Licensed.

UNTIL the present scheme of licensing road vehicles came into force there was no reliable means of defining the exact number of motor cycles on the road. The registration figures were distinctly misleading, as they included many motor cycles which had been either dismantled or were in a state which rendered them quite unfit for use.

Now that the licensing scheme has been in working order for some months, the authorities are able to disclose the fact that the number of motor cycles licensed to be used upon the road is 186,000, while they mention that they are bringing into the State the amount of £492,400. This refers to motor cycles including sidecar outfits and three-wheelers registered in the United Kingdom.

In March last year the Government estimated that the number of motor cycles would amount to 265,000 at Midsummer, 1920, and that they would bring in £850,000 to the licensing authorities. It will be seen therefore that the estimate is so far exceedingly wide of the mark.

Discussing the matter with the Secretary of the Auto-Cycle Union, he suggested to us that his original estimate of 200,000 was not very far wrong, and he imagined that some 14,000 or 15,000 had not been licensed at the present time. Undoubtedly there is a large number of motor cyclists who, only using their machines in the summer months, have not yet put them in commission, also there are quite a number who own more than one motor cycle, but so far have only licensed one. It would be interesting to know the proportion of sidecar outfits to motor bicycles in the figures mentioned, and also the number of three-wheelers.



High Speed Trials.

IN this country where road racing is illegal, reliability trials may yet be turned into "races" by utilising a legal limit schedule over routes which involve roads not normally, or ordinarily capable of being, traversed at such a pace.

Last week-end the two day trial in Wales became a scramble; on the same roads a speed of 15 m.p.h. was scheduled over the difficult sections in the A.C.U. Six Days Trials of 1919, but in the event mentioned 20 m.p.h. was required throughout. The extra 5 m.p.h. turned the affair into a trial wherein the extreme danger to competitors and public was obscured by perfect weather conditions and splendid organisation. The hills throughout caused no trouble, and it is evident that modern trials make greater and greater demands on the skill and daring of the riders rather than upon the capabilities of their machines.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments by "Ixion"

The B.T.H. Sparklight.

JUST at present I am trying out one of the new B.T.H. lighting outfits which taps the idle maximum of the magneto, and uses this surplus juice to light a pair of pretty little lamps. I had been warned by various croakers that the light was not good enough to beat a glow worm, but this is a foul libel. The outfit appears to be entirely reliable, and the illumination is plenty good enough for my 1921 baby two-stroke, which can do its 45 m.p.h. at a pinch. It is beautifully made, well fitted up, and the rustable surfaces are reduced to almost a minimum. I think I am going to like it extremely.

The Carden Cycle Car.

WHEN a £100 cycle car has the impudence to enter for a Land's End Trial, and moreover put up at least as good a show on Lynton Hill as any rival, the sidecar begins to feel the draught. Other very cheap vehicles also covered themselves with glory at various stages of the crack Easter trial—to wit, the Dunelt sidecar outfit on Lynton, and the little 8 h.p. Rover carettes on Porlock. Competition is going to be remarkably keen all summer in the cheap passenger lines, which represent enormous markets waiting to be secured by the firms who make good. One swallow does not make a summer, and we must wait for the Six Days to reveal the 'buses which have stamina as well as the capacity to put up brief stunts. But it is already clear that riders prepared to pay £200 or so in 1922 will expect a lot for their money.

'Ware Noise.

BROUGHT up from my cradle to regard the police as my natural enemies, I nevertheless feel a certain sympathy with them when they attempt to penalise excessively noisy motor cycles. After all, the bulk of the population of these islands live in small houses close to the road, and can never escape from the noise of local traffic as the rich man does with his secluded house standing in large grounds. Motors, to my mind, are steadily getting noisier, in the sense that, though one can buy a quieter car or cycle than ever before, the average touring motor cycle and the average sporting car have exhausts which would never have been tolerated a few years ago. I have just taken delivery of a mount which must rank as a potterer. It is only 2½ h.p., and weighs about 160 lb. But it makes the most abominable cackle, and, being designed for a high performance in proportion to its c.c., it will not run particularly slowly. Two of my 1920 machines erred in exactly the same way. These noisy exhausts bother elderly and invalid people by day; and at night they must be simply intolerable to nervous folk compelled to live in a small house close to a busy road. If we take wakeful babies, sick persons, and the aged into account, it is probable that a third of the population is adversely affected by noise at night. Also, seldom do motor cyclists venture down the lane on which my abode is situated, so that my remarks are prompted by the pure milk of human kindness.

£3 17s. 6d.

ON taking delivery of a new mount recently, I discovered that none of my acetylene lamp sets would fit, thanks to the special non-twist method of attaching the handle-bar. So I strolled into the local dealer's, sorted out a small black-finished lamp and generator outfit, suited to the trim lines of a small machine, worth at the outside 25s. in pre-war days. When I asked for the bill, it came to £3 17s. 6d. I mention the cost in no carping spirit—most of it is due to increased wages, and my own expenses have gone up so colossally that I grudge no mechanic a living wage. No! I only recount the incident for the benefit of other innocents, who, like myself, have bought no accessories since 1914, and have omitted to notice what gadgets cost nowadays. But I should have returned home with a better grace if the dealer had not fixed the lamp so low that it hit the front fork on the first pot-hole, and neatly decapitated the two oil helmets which adorn the top spindle thereof. Moreover, it was raining cats and dogs when I paused perforce to cant the bracket.

Too Many Levers?

I AM engaged in teaching a completely unmechanical person to ride a motor cycle, and the main difficulty centres round the bewildering variety of controls. The machine in question is not particularly complicated, but the unfortunate tyro has to master the use of the following:

(1.) Two carburetter levers.
(2.) One ignition lever.
(3.) One compression release.
(4.) One gear lever.
(5.) One oil control.
(6.) One kick-starter.
(7.) Two brake controls.
(8.) One clutch control.

The nett total is ten levers and pedals, not to speak of such minor items as odd taps and cocks. The multiplicity of these controls is further complicated by the fact that to a beginner several of them seem to serve roughly similar functions. For example, the throttle and the compression release both stop the engine, whilst the air lever will do the same on occasions. The clutch and the gear lever both disconnect the engine from the driving wheel. There seems to be room on the market for a duffer's machine equipped with a single-lever carburetter, a P. and M.

Ixion's "MOTOR CYCLE REMINISCENCES" have lately been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

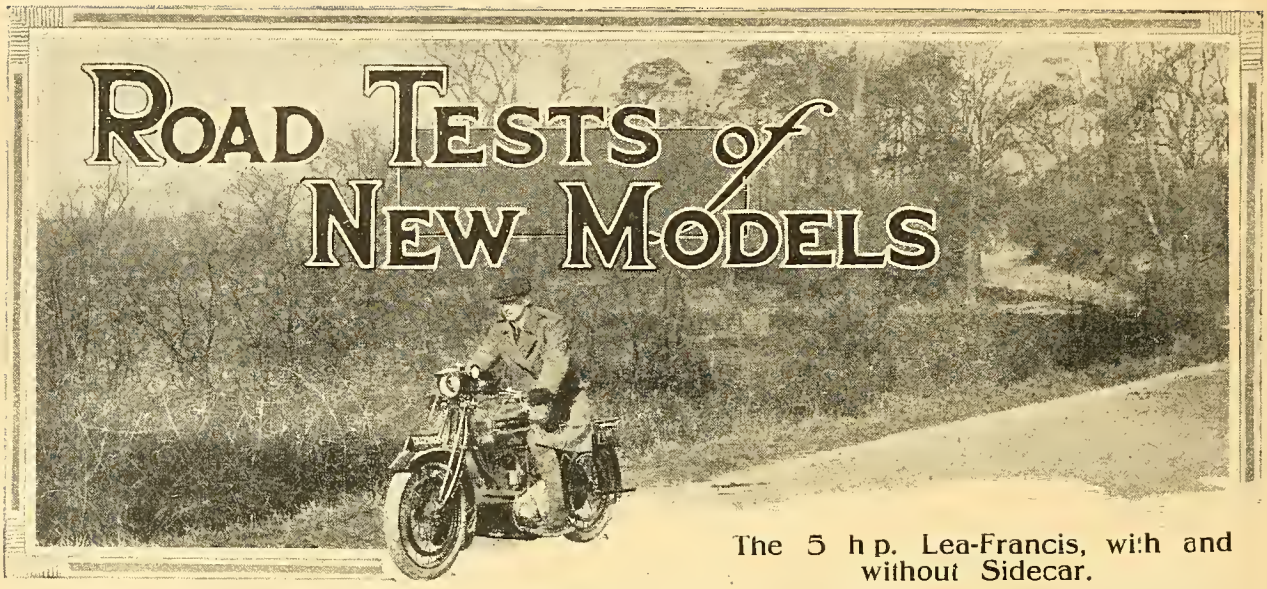
type of gear-cum-clutch control, fixed ignition, automatic lubrication (*à la* Hawker two-stroke), etc. Most of our readers are sporting and technical; but there are many would-be motor cyclists who would appreciate a 'bus they could ride without prolonged tuition. One remembers that in the very early days when nobody knew anything about petrol engines, a single lever was used to operate gas, spark, compression release, and ignition switch; and that the Quadrant people annexed an excellent trade by thus bearing in mind the ignorance of many persons requiring cheap transport.

An A.J.S. Outfit.

RECENTLY a fine A.J.S. sidecar was at my gate, and I fell to comparing it mentally with a weird variety of cycle cars which have visited me of late. I selected three items in respect of which such luxurious sidecar outfits are still superior to the average cycle car. They are *substantial*—they do not wobble and flap and rattle like some of their would-be successors. They evince a higher standard of *reliability*, and do not shed oddments along the roadside. They are *nice-mannered*—not quite so raucous on full throttle, not so dithery and spit-and-bangy when running in free engine. Let the cycle car add these qualities to its already sound performance and its excellent weather protection. Then—and not till then—the sidecar will have to look to its laurels.

THAT EXTRA HOUR OF DAYLIGHT. The motor cyclist is not slow to take advantage of the daylight saving which came into force last week, and, combined with the beautiful weather which has characterised this spring, he is able to enjoy many evening runs. Incidentally, the picture shows that it is not always necessary to use the stand on a sporting solo Sunbeam.

Faithful and True.



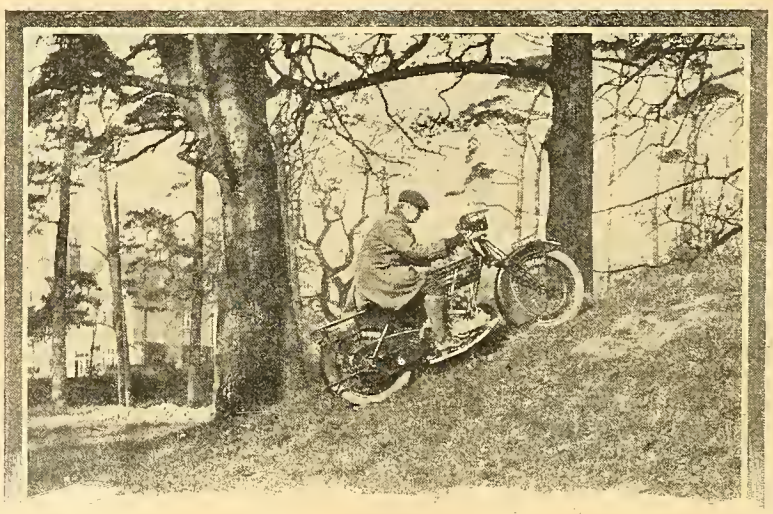
I PROVOKED a vituperative correspondence when I recently penned a jesting paragraph on my unfortunate experiences with a trade-loaned belt-driver, equipped with ancient belt tools. It is quite clear that the belt drive is still rightly beloved by a very large section of our readers. *Pour moi*, I would never drive anything else if it was not for the infernal trials which misguided clubs will persist in organising, thereby compelling poor pressmen to tackle country which no sane rider really wants to visit; and even at that I would still be a sportsman and take an I.O.M. Rudge trial riding, if it was not for the still more infernal weather, which so often puts a belt-driver right down the course. In sober fact, I *always* keep a belt-driver for what one may call normal riding-potters and scraps in the home zone. But trials take one into regions which can only be described as Heath Robinson's idea of a quarryman's hell. And there a belt-driver is generally out of place. Many thanks to those kindly correspondents who recommended sundry belt tools; I have quite a shrewd selection packed in my own toolbags.

Pity the Poor Journalist.

A TRADE 'bus arrived for trial. I examined the kit, and found there was not a tool of any sort on board. I keep a small pocket case for such emergencies, containing a tyre repair outfit, a belt punch, a small King Dick, and a screwdriver. Stuffing this in my pocket, I took the road. Ten miles from anywhere came a small misfire, followed by a complete engine stoppage. I dismounted with my mind evenly divided between a choked jet and a sooted plug. After a somewhat caustic glance at the carburetter, which was jammed up against the off side legshield in a manner which forbade all reasonable access, I decided to gamble on a sooted plug, and quick-marched round to the near side of the 'bus. Picture my agitation on discovering that the plug was snugly ensconced amongst a stockade of vertical fins, which made any spanner useless except a tube pattern 3in. long, *i.e.*, a tool which probably does not exist outside the factory where the 'bus is made. So I backed the second favourite, and took the carburetter to bits. All clear. I had another good look at the sparking plug. It was useless to wait for a passing motor. So I seized my screwdriver, sought for a large stone, and batted that plug round till it was finger-loose.

A brand new K.L.G., gentlemen! The pity of it!

ROAD TESTS of NEW MODELS



The 5 h.p. Lea-Francis, with and without Sidecar.

SPECIFICATION.		
ENGINE: 64 × 92 mm. (592 c.c.) M.A.G.	CARBURETTER: Amac.	FORKS: Brampton.
LUBRICATION: Drip feed.	GEAR BOX: Three-speed.	FRAME: Rigid.
MAGNETO: T.B.	TRANSMISSION: ½in. chains	WEIGHT: 280 lb. solo
	WHEELS: 26 × 3in.	PRICE: £145.

"A BEAUTIFUL machine but hardly enough power for sidecar work." This is one of the few criticisms heard with regard to the well-known 3½ h.p. Lea-Francis, and since the machine was primarily designed as a solo mount such criticism is perhaps hardly fair. Knowing the demand for a sidecar mount Messrs. Lea-Francis set to work to produce a slightly larger model, having as a power plant the 5 h.p. M.A.G. engine.

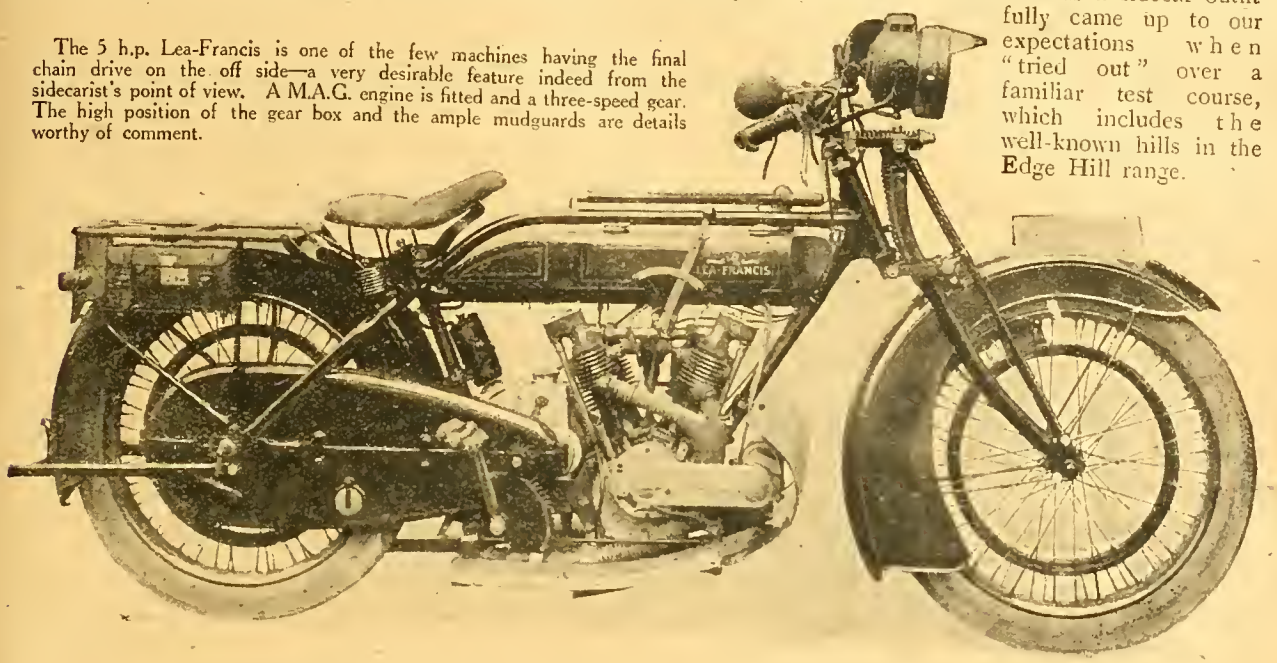
This engine is identical with the 3½ h.p. M.A.G., except for a longer stroke, and it is wonderful what a difference the addition of a few millimetres make to the power output. The 5 h.p. engine runs sweetly and quietly, but develops ample power for the most exacting requirements of the normal sidecarist. A glance at the new model reminds one strongly of previous Lea-Francis productions, but there are two notable modifications. First, the clutch is fitted on the engine shaft—where a lighter clutch can be employed—and a new three-speed gear box is mounted directly behind the engine.

The Lea-Francis underwent more than an ordinary road test; stiff grass banks were included, but nothing of sufficient gradient was found in the district that proved a real test of the hill-climbing capacity of the machine.

This gear box, though normal in action, is somewhat unusual in appearance, since the selecting mechanism is carried above the shafts and is directly surmounted by a large and accessible filler cap. Further modifications consist of Brampton Biflex forks and 26in. × 3in. tyres.

Our first road impressions were gathered with the machine as a solo mount. A rather long frame and straight test bars made the riding position slightly awkward, especially at low speeds, but this will be corrected by the standard bars.

The controllability of the machine was immediately noticeable, and once clear of traffic a touch of throttle caused the engine to accelerate rapidly and smoothly.



Two facts stood out above all others, the extraordinary flexibility of the machine and the impression of power without clumsiness. On top gear the engine could be throttled down to the merest crawl or opened up to extremely high r.p.m. Naturally a very slight snatch is noticeable when accelerating from 5 or 6 m.p.h. on

Road Tests of New Models.—

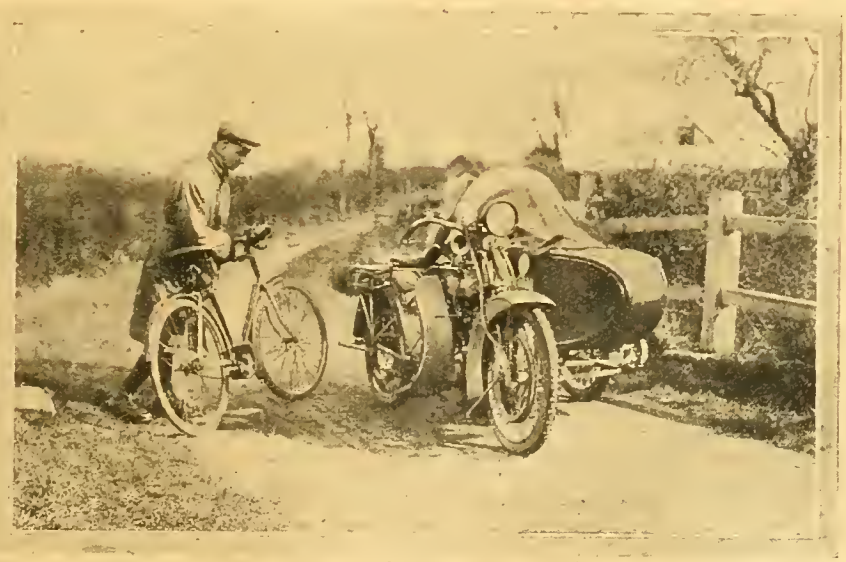
top without clutch manipulation, but this is not a fair test, and the shock absorber under normal driving conditions is excellent.

On the occasion of our trial the surface of Stoneleigh hill was in bad condition, but less than half throttle on top gear took us over the top quite as fast as was desirable. Both brakes are good, the mudguarding excellent, and the detail finish in keeping with the reputation of the firm for high-class work. Starting is easy, and comfortable footboards, with boot shields incorporated, are part of the standard equipment.

Later we were able to try the machine with sidecar fitted, and in spite of the somewhat heavy type of body, the capabilities of the Lea-Francis as a sidecar outfit fully came up to our expectations when "tried out" over a familiar test course, which includes the well-known hills in the Edge Hill range.

The 5 h.p. Lea-Francis is one of the few machines having the final chain drive on the off side—a very desirable feature indeed from the sidecarist's point of view. A M.A.G. engine is fitted and a three-speed gear. The high position of the gear box and the ample mudguards are details worthy of comment.

THE 6 h.p. B.S.A. SIDECAR.



An Extended Road Test involving Lengthy Journeys without Spares.

THE name B.S.A. has been associated for so many years with single-cylinder engines that quite a number of motor cyclists fail to realise that a twin-cylinder model is already on the market and giving admirable results.

On a recent occasion a well run-in 6 h.p. machine fitted with a roomy sidecar, Lucas Magdyno, and very full equipment, was handed over to us for trial purposes. Such was the manufacturers' confidence in their production that, with the exception of a spare wheel, no other spares, and only a few tools were supplied.

One is at first inclined to be anxious when taking over a strange machine under such circumstances, but it must be admitted that the confidence of the manufacturers was fully justified, and that throughout our trial, which extended well over 400 miles, not a nut was touched or a tool of any description needed.

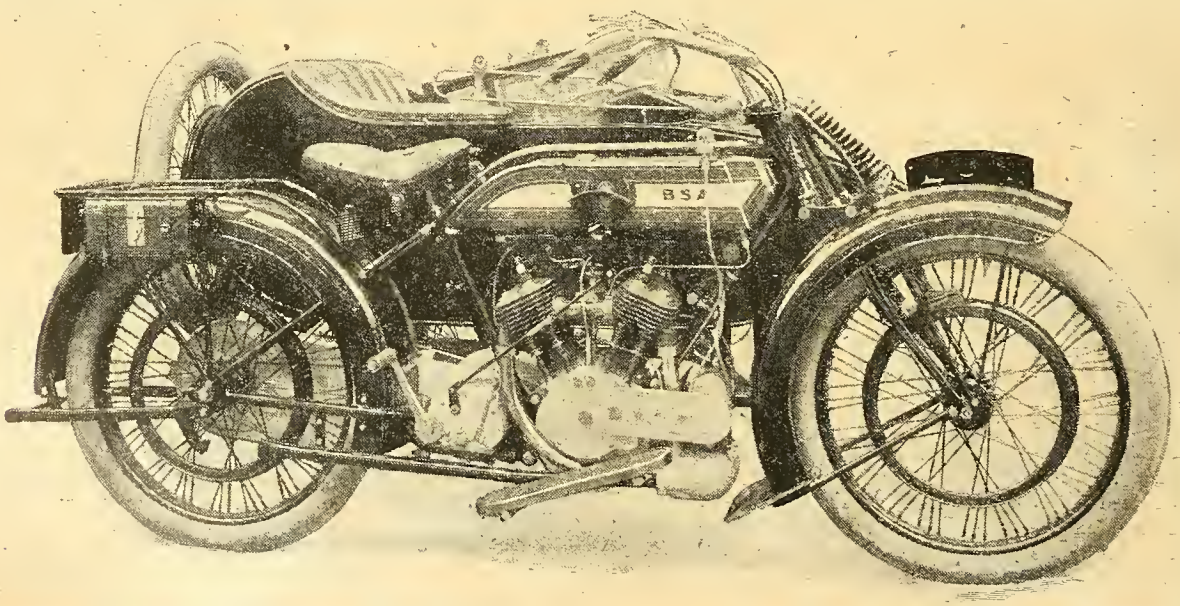
First as regards power, the 6 h.p. twin-engine appears to relish hard work, and a fully loaded sidecar makes little difference to its average performance. Any ordinary hill can be negotiated on top gear with ease, and though the long pull to the

Admiration, criticism, or envy—which? A passer-by interested in the big outfit.

summit of Cleve Hill, approaching Cheltenham, demanded middle gear for a short stretch, this was largely accounted for by a strong headwind.

The speed of the outfit was all that is required of a big passenger machine, and approximates to double the legal figure. Hard driving appears to have no ill-effects, and even after prolonged speed work there is not the slightest symptom of overheating; in addition, the balance is excellent, though at high speeds the valve gear is inclined to be noisy.

Both these illustrations give some idea of the unusual height of the sidecar body, which enables the passenger to see more of the country than when reposing in a sidecar fitted on a very low chassis. An ample locker is provided at the rear of the sidecar body where the spare wheel is carried.



The new B.S.A. handle-bar controlled clutch is as sweet in action as anyone can desire, and the gears change easily and sweetly once one has grown accustomed to the gate quadrant.

Starting was easy, even on the coldest mornings, and all lubrication worries are removed by the B.S.A. mechanical pump, it being only necessary to glance occasionally at the sight feed in order to see that a regular supply is being maintained.

Petrol consumption was on the heavy side, but we had been warned that the carburetter had been set for power rather than economy, and certainly we obtained the impression that a considerable reduction in jet size might have been effected without materially detracting from power or ease of starting.

One of the many good features of the 6 h.p. B.S.A. is the width of the mudguards; the rear guard in particular is excellent, and the front guard is considerably better than the average, and combined with ample leg shields protects the rider under the worst conditions.

Though the need was not experienced, it is a simple matter to change a wheel owing to the excellent system

Sturdiness of construction is an outstanding feature of the big twin B.S.A. The 6 h.p. engine is 76 × 85 c.c., and is capable of sustained high speeds with a heavy load.

Road Tests of New Models.—

employed of using a splined driving hub and interchangeable wheels throughout. A spare wheel is carried on the rear panel of the sidecar.

Both front and rear chains are enclosed in cast aluminium cases, which should prolong the life of the chains to a large extent by keeping them free from road grit.

Our road test included part of the Colmore cup trial route, a trip from Coventry to Newark, and a certain amount of daily "hack" work. Under no circumstances did the 6 h.p. B.S.A. give the slightest trouble, nor did we ever experience even a misfire—in fact, the steady, even pulling, and smooth running engine are perhaps the most characteristic features of the machine.

Our passenger reported an exceptionally roomy and well-sprung sidecar body, with a thought too upright a position, but with an Easting windscreen, providing most admirable protection under the most adverse weather conditons.

Those who are already B.S.A. enthusiasts, but require rather more power, or those who only know the B.S.A. big reputation and need a thoroughly sound twin-sidecar outfit, should certainly consider the 6 h.p. model, which should fulfil all the requirements of the touring motor cyclist.

One point more must be mentioned. As a result of our test we were very much impressed by the fact that, although the maximum speed of the outfit is not out of the way, a speed of within a mile or two of maximum can be attained on a comparatively small throttle opening, and can be maintained as long as road conditions admit. For this reason the 6 h.p. B.S.A. is capable of as high an average speed as is desirable over give and take roads.

SPECIFICATION.

ENGINE: 76 × 85 mm. = 770 c.c. V twin B.S.A.	*TRANSMISSION: ⅝ × ⅜in chains.*	*TYRES: 28 × 3in.*
CARBURETTER: B.S.A.	*LUBRICATION: Mechanical.*	*FORKS: B.S.A.*
MAGNETO: E.I.C.	*GEAR BOX: Three-speed B.S.A., with clutch and kick-starter.*	*PRICE: £198, with sidecar.*
		WEIGHT: 350lb.

THE LONDON-EDINBURGH INNOVATION.

As did the Porlock-Lynton section in the London-Land's End Trial, and Kirkstone Pass in last year's London-Edinburgh, so is the inclusion of Buttertubs Pass in this year's M.C.C. Whitsuntide run creating a great deal of interest. Several readers have written giving details as to the condition of this new section, and below we publish a typical letter from Mr. J. Shaw, of Preston, who traversed this part of the route last week.

"I consider many parts of the route suicidal," he writes, "not so much on account of the gradients, of which generally my 2¾ h.p. Diamond made light, but of the surface. From Cray Gill to north end of Kidstone the surface is atrocious, generally big loose stones. Through Bishopdale, Thoralby, Aysgarth, Bainbridge, to Hawes, is good going, but from High Shaw at the entrance to Buttertubs Pass to Nateby, near Kirkby Stephen, there are many very rough and dangerous patches. At intervals of about every fifty yards over Birkdale Moor (between Keld and Nateby), there are short lengths (seven or eight yards) of newly laid-on broken stone. There is little or no chance of dodging these bits, and to take them at anywhere near 20 m.p.h. would be very risky. By May 13th, the traffic over these sections will not have flattened out these patches, and the steam roller on that high land is out of the question."

Buttertubs Pass, which is included in the new section of the London-Edinburgh Run that takes place on May 13th and 14th. This hill was included in the 1913 A.C.U Six Days Trials, and caused little trouble to competitors

DAY TRIPS AND WEEK ENDS

High Force Falls, Riddleton.

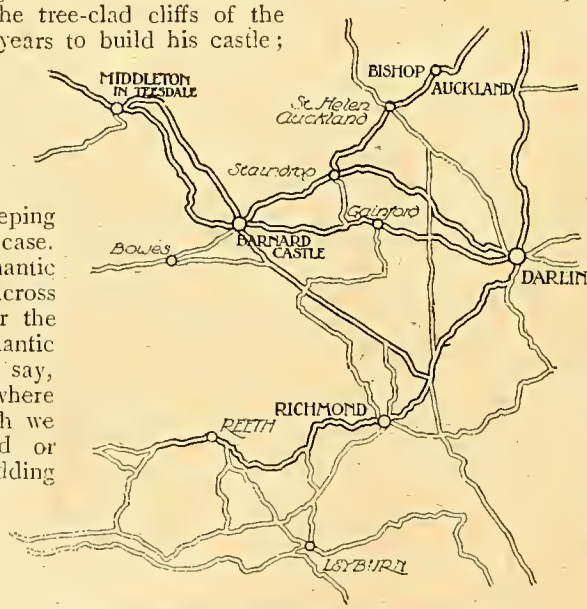
by Charles G Harper

BARNARD CASTLE and round about

BARNARD Castle is a considerable touring centre. Look on the map and you will find many roads radiating from it. For its convenience, rather than for itself, this town is a good deal visited. Westward is Brough, sixteen miles, and Penrith, thirty-seven; north-west Middleton-in-Teesdale, eleven miles, with Alston beyond, another twenty-two; Durham is twenty-five miles north-east; Darlington sixteen miles, and Middlesbrough fourteen, east; and Boroughbridge forty, and York fifty-eight, south.

Probably ninety-nine people out of a hundred think Barnard Castle is in Yorkshire. It is, in fact, so nearly within it that no guide-book writer to that shire of more acres than there are letters in the Bible (more precisely, 3,882,851 acres in Yorkshire, and 3,566,482 letters in the Bible) ever has or ever could afford not to mention it. For the best views of town and castle are across the river Tees, from Yorkshire, to which it thus scenically belongs, if not in other ways. The "Barnard" to whom the place owes its name was actually "Bernard," that strenuous Bernard Baliol who established himself on this rocky site by building that fortress whose ruins still rise so grandly from the tree-clad cliffs of the Tees. It took him twenty years to build his castle; from 1112 to 1132.

Avoiding Disillusion.

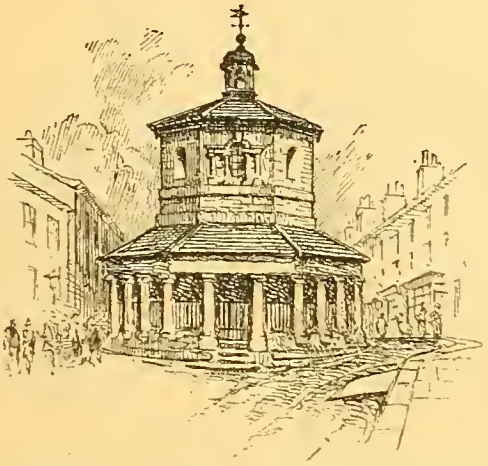


You might well suppose that the town which grew up around that feudal pile would be picturesquely in keeping with it; but that is not the case. If you would keep your romantic illusion, do not adventure across the high-pitched bridge over the river, but gaze upon the romantic ruin; and so away into, say, Wensleydale, or indeed anywhere save into those streets which we shall find so hard-featured or past those starkly-forbidding stone houses which for the most part make up Barnard Castle town. The ancient and beautiful old houses are the exception; for the town in the eighteenth century made almost a complete sweep of them, and the curious tall old mansion called "Blagroves" is alone really fine, and that is dilapidated. Thus "Barney Cassel, the last place that God made," has become the best known by-word in all these parts. Everything objectionable, from a tramp to a thorough-paced lie, is supposed by all the surrounding places to come from this town. Barnard Castle has associations with Dickens. It was in 1838 that he visited the town, to get local colour for "Nicholas Nickleby" and for his description of the infamous "Yorkshire schools" of that period. Squeers's dreadful academy, "Dotheboys Hall," is still pointed out at Bowes, five miles distant. Dickens stayed at the "King's Head," still a going concern. "There is good ale at the King's Head," said Newman Noggs. "Say you know me, and I am sure they will not charge you for it."

The "King's Head" of To-day.

The "King's Head" is there, right enough, in the Market Place, but they don't take much stock there in Dickens, and it is quite hopeless to attempt free drinks on the naming of Newman Noggs—or anyone else, for that matter.

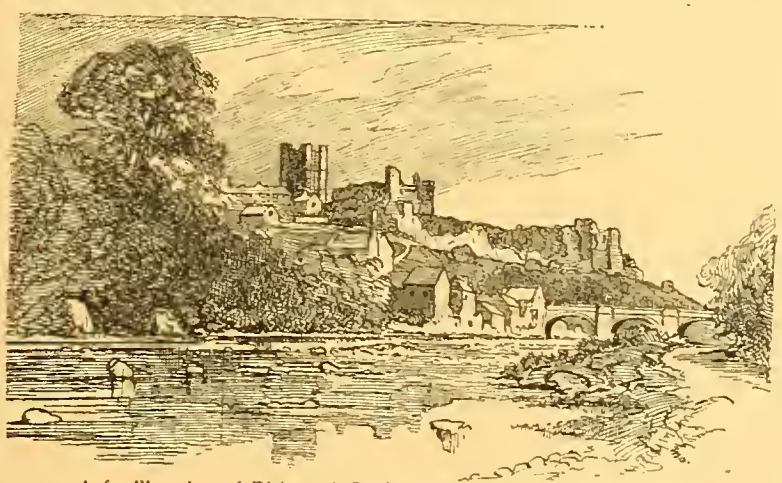
The Market Place of Barnard Castle is a grim place, like the town itself. There the Market House stands, dully classical. It was built in 1747, and lacks everything that date implies. It is market house and lock-up too.



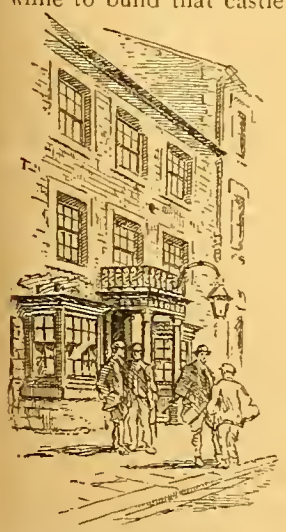
It is east and north-east of this centre that all the striving business lies, and west and south most of the wild and beautiful scenery. Thus on the long road to Alston we came past Lartington and Cotherstone, Balder Bridge and pretty Romaldkirk, a lovely route, to Middleton-in-Teesdale, with the Tees winding away in its gorges on the left, and then in another five miles to the High Force Hotel. Half a mile from the road is found the

Showing the roads radiating around Barnard Castle.

Day Trips and Week Ends.—



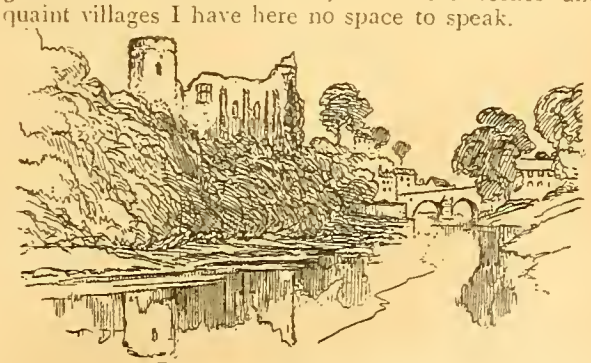
most impressive waterfall in the North of England, the High Force. Had Southey ever visited this magnificent spectacle, surely never would he have had the heart to write his poem on "How the water comes down at Lodore," for the cascade there is a poor thing compared with this fall on the Tees. It is a fall of some sixty-nine feet; not the loftiest cascade, certainly; but the mass of water and the setting of the scene render it easily of the first rank. Here the water comes down between dark, iron-hard cliffs, dashing into a deep pool, and thence proceeds by a series of minor cascades down to Middleton.



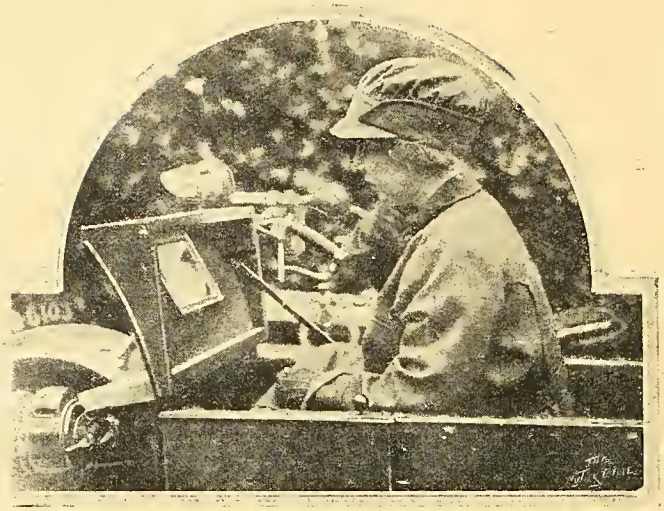
Amidst much unimpressive architecture in the town of Barnard Castle, the old Market Hall stands out.

Dotheboys Hall.

To reach Bowes and the road to Brough, we cross the Tees Bridge, and in less than two miles come to Cross Lanes, turning there to the right. Bowes was a Roman station, *Lavatrae* by name. One wonders, a little curiously, what the Roman centurions and legionaries thought of the forsaken moorlands round about, and why the Normans thought it worth while to build that castle whose stern keep yet stands on the windswept fell-side. Modern Bowes seems to have none of the graces of architecture, any more than its scenery has the beauties of nature. It seems a fit setting for the cruelties of "Dotheboys Hall." Beyond this place the road grows wilder, up to Stainmoor; and passing Brough, whose old castle wall fell down quite recently, after eight hundred years of standing up, comes into the pleasant old town of the pleasing name, like that of some Promised Land—Appleby-on-the-Eden. And so on, if you will, into Penrith, in another thirteen miles or so.



A familiar view of Richmond Castle, an ancient relic rich with historic and tragic memories.



An old hostelry in Barnard Castle where Charles Dickens once stayed—the King's Head.

Or we may try south, into those Yorkshire dales whose entrance is past Richmond. Leaving Barnard Castle in a southerly direction and passing the ruins of Egglestone Abbey, we come past Rokeby Park to Greta Bridge, where the Greta joins the Tees in a deep glen. This was an important coaching and posting place, and the old "George" inn was a prosperous wayside house. Thus we proceed along the long straight Roman road for seven miles, thence bearing right for Gilling; crossing in a further four miles down into Richmond, a decayed town of 3,800 people, with its sett-paved Market Place, where you find houses and shops oddly embodied with Trinity Church, and a general look of Has Been, not perhaps very pleasing to the inhabitants, but with a very great charm for ourselves, who are, it may be, a little too much used to the pushful communities of to-day. To present-day motor cyclists Richmond has a special appeal; it forms a rallying point between the iron working and ship-building Tynesiders, the East Yorkshire agriculturists, and the weavers, engineers, and miners of the West Riding. Annually, on Good Fridays, its streets are thronged with the men and their machines from all these areas, and the "Richmond Meet" has become established by custom. But the chief object of interest here is the Castle, whose ruined curtain walls and great Norman keep form so lovely and romantic a picture from the other side of the Swale; that river which gives a name to Swaledale, of whose scenes and quaint villages I have here no space to speak.

The ruins of Barnard Castle.

THROUGH FEMININE GOGGLES

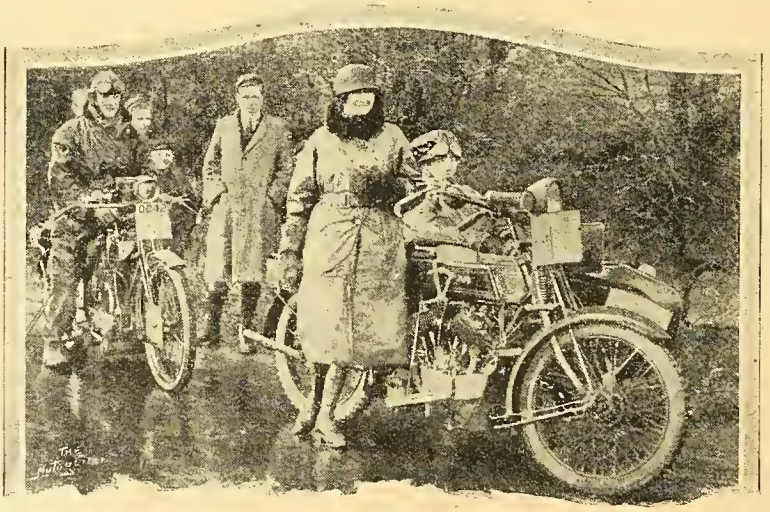
Some Disconnected Jottings Reflecting the Opinions of Lady Motor Cyclists.

Edited by "Minnehaha."

THE recent article by Miss Peggy Fraser published in the issue for March 17th, on the eternal question of dress, has aroused much interest. Many ladies have written expressing their appreciation of the suggestions contained in the article, while others have made suggestions in a like direction. I should like to hear from others.

One letter before me is from a reader in Devizes, who, being interested in Miss Peggy Fraser's article, makes another suggestion regarding suitable attire for riding, which, she says, "neither attracts attention by being dowdy nor is masculine in appearance." The specification, as our menfolk would say, is as follows:

For Summer and Winter Wear.



"The rig-out comprises a divided skirt, three-quarter length brown leather coat with a musquash collar (which may be worn turned up or down), and gauntlets of the same fur; suède close-fitting hat of any shade to tone with leather coat; brown brogues and woollen sports stockings to match the skirt for winter wear, and brown calf leggings on dirty roads. The skirt is made similar to the one described by Miss Fraser, consisting of a heavy Scotch tweed in a check design, front and back-lined waterproof, and fastening with buttons from the waist to hem; about three of these are unbuttoned for riding and fastened round the leg. When off the mount these are buttoned up in the ordinary way and form a smartly cut sports skirt of about two yards wide.

"With a woollen jumper or sports coat, which gives the necessary warmth under the leather coat, it makes quite becoming wear when off the machine. For the summer a costume of lighter weight tweed and a bluff or biscuit suède close-fitting tagel hat are most useful.

"I prefer a brown leather coat for serviceability, as it does not show the dust very much, and oil—of which one is doomed to get a little—is not noticeable."

Another reader, who signs herself "Malicia," gives some reminiscences. "I read *The Motor Cycle* every week," she writes, "sometimes because I want to, and sometimes under protest (the latter, when my motor fanatic husband is positively certain that there is a wonderful article I should not miss). In our early married days we were the proud possessors of a couple of push cycles, and we enjoyed the fresh air and beauties of nature to the full; but, alas! my husband grew ambitious, and in a rash and reckless moment bought a decrepit 1914 motor cycle and basket sidecar, the latter very much resembling one of those affairs in which gouty old gentlemen are wheeled about. To recall all our thrilling adventures with this outfit would require two volumes; let it suffice when I tell you that we tore about the country at the alarming rate of 12 m.p.h. (occasionally we touched 15), making as much noise as fifty knuts on N.U.T.'s all out minus exhaust pipes, much to the edification of sundry small rude boys, and the exasperation of various smartly-uniformed chauffeurs, who were obliged to drop into low gear behind our madly racing 'bus!

"Eventually, after a wonderful speed burst, the cylinder top blew off, knocking the bottom out of the petrol tank in its passage, and incidentally gaining us more fame, for the moment, than ever Charlie Chaplin enjoyed. I blush now when I think of it. No matter how smart one's suède hat may be, or how fascinating the veil one has to match—it is impossible to look dignified in such circumstances. You will observe I do not mention hubby's feelings. 'Tis better so."

Mrs. Duncan Bell, snapped during the Glasgow Western M.C.C. Trial, in which she was successful in gaining the A.J.S. trophy for the best performance. Appropriately enough, her mount is an A.J.S.

Through Feminine Goggles.—

Malicia concludes with a homily to "Sweethearts and wives." "If you really want to know your menfolk," she says, "go out motoring with them, and at every *contretemps* offer such grateful and comforting remarks as 'Can't we go any further, dear?' 'Will it be any help if I get out?' or 'Is my hat on straight?' If you still feel that you can love him after he has replied, you must be very fortunate in your choice or else you are very deaf."

Ladies' Successes in Competitions.

By the way, our lady readers will have been pleased to note that several motor cyclists of our sex have been successful of late in competitions, and, I am sure, will join with me in offering congratulations to Mrs. Duncan Bell, who, with her 7 h.p. A.J.S. sidecar, won the A.J.S. Trophy and a gold medal in the Glasgow Western Centre M.C.C. Trial at Easter. This was a splendid performance, and one of which we should be proud. I cannot recall of recent years a lady taking the premier award in level competition with men. There were thirty-four starters, and only nine survived the course.

Then there is Mrs. L. Luddington's success in the Bedford and District M.C.C. petrol consumption test, in which she won her class; Miss Cottlet, of Liverpool, who rode seventy-nine miles to the Ribchester Rally, and was awarded for her enthusiasm; and Miss Cowley, of Manchester, who won the prize for the most suitable costume (I should like a photograph if Miss Cowley will be good enough to send it along).

In speed events I have noted that Mrs. Jennison, who rides a 2¼ h.p. Velocette, put up some startling speeds at the East Midland Centre Speed Trials at Grimsthorpe Park. The course was slightly on the down grade, and her speed works out at nearly 70 m.p.h.

Finally, there are Miss Ireland, of the Barrow M.C.C., who was awarded the prize at Richmond for the lady riding the greatest distance; and Mrs. Gilchrist (6 A.J.S. sc.), who gained the award for the best kept lady's machine.

(Top) Mrs. Jennison, who competed at the East Midland Centre Speed Trials at Grimsthorpe Park, and attained a speed of nearly 70 m.p.h. on her little Velocette.

(Left) Miss Ireland (3¾ Scott sc.), of the Barrow M.C.C., and (Right) Mrs. Gilchrist (6 A.J.S. sc.), who were both successful in winning prizes at the Richmond Meet.

SAFETY IN NIGHT DRIVING.

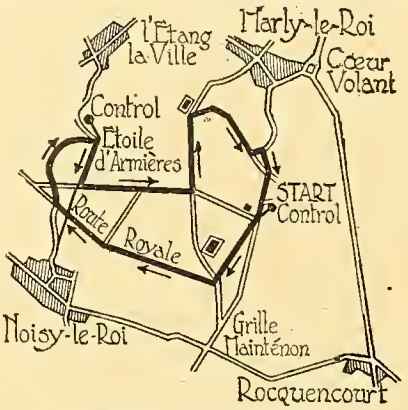
THERE is still room (says *The Autocar*) for improvement in the rules and regulations governing the position of lights on modern road vehicles. When trucks and trailers are being drawn by a traction engine each should carry a light upon its right-hand side, so that other road users can see plainly exactly what they are meeting. Also when an engine is towing trucks, etc., every truck should be provided with a red light to the rear; and when any part of a load projects more than three feet beyond the rear light the load itself should also carry a red light at its extreme end.

France Recognises the Value of Trials.

British Reliability Trials to be Patterned by the Union Motocycliste de France.

From "The Motor Cycle" Continental Correspondent.

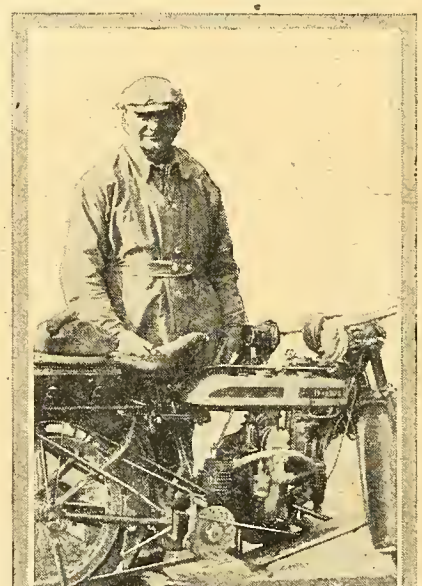
IN some countries, between the motor cycle and the car element a certain amount of antagonism sometimes exists, for the owners of the more costly machines are inclined to look with some disdain upon their smaller brethren, and these latter resent what they consider to be the patronising attitude of the lordly car owner. In French motor cycle sporting events there is fortunately very little of this spirit, and probably this is owing to the fact that the more prominent leaders of the movement are acknowledged authorities in the big car world. As an example, the Union Motocycliste de France, which corresponds in practically all respects to the A.C.U. in England, has as its head a sportsman whose reputation was made in the motor car world, and who has been most intimately connected with both the sporting and the industrial side of the motor car movement from its inception.



A Pioneer Motorist.

As a cyclist, Chevalier René de Knyff was not much impressed with the earliest motor cars, for he could beat them up any hill, and on a long run he generally arrived home before them. It was not until Levassor had won the Paris-Bordeaux and return race, at an average of 15 m.p.h. for 750 miles, that M. De Knyff developed any enthusiasm for the motor car. This average was so far superior to anything attainable by the ordinary cyclist that he resolved to become the possessor of a car. His first machine was a Panhard-Levassor with steel tyres, hired by the month, which he learned to drive himself, for the simple reason that there was nobody available to give him lessons. The first car owned by M. De Knyff was a Panhard-Levassor four-seater dogcart, which was delivered to him in 1897, and was equipped with pneumatic tyres, being the first of its kind produced by this factory.

During the whole of that early period, when the object of motor car races was to prove the reliability of machines rather than their speed, there was not an important town-to-town race in France in which M. De Knyff did not take part, generally with conspicuous success. When the Automobile Club of France formed its Racing Board, in 1899, M. De Knyff was elected chairman, and has occupied that position until the present day, thus being personally responsible for the early races from town to town, followed later by the Gordon-Bennett and the Grand Prix events. If any other proof were needed of the attachment of M. De Knyff to the car movement, it is to be found in the fact that he is a managing director of the Panhard-Levassor Co., a firm which has never built anything but motor cars.



Enthusiasm for the Motor Cycle.

Notwithstanding, however, his connection with motor car racing, and his interest in the motor car industry, M. De Knyff's greatest enthusiasm inclines towards the motor cycle. As president

The black lines denote the course of the French non-stop trial, to be held on the 24th inst.

of the Union Motocycliste, he is not content to follow motor cycle events from afar, but takes part in them with all the vim of the newcomer. "Monsieur le Président" appears to have found the secret of perpetual youth, for there is nothing he likes better, despite his fifty-six years, than to put his family inside a comfortable limousine, while he gets astride one of the several motor cycles

Chevalier René de Knyff, president of the French Racing Board, and of the Union Motocycliste de France. His mount is a Douglas.

which occupy a place in his garage. The party unites again at midday, or at the end of the trip, and the veteran motorist, who has travelled all over Europe in every kind of self-propelled vehicle, from the high-wheeled Panhard-Levassors of 1897 to modern hundred-miles-an-hour racers, declares that there is nothing so enjoyable as a long trip astride a modern two-wheeler. It was in this way that he followed last year's Six Days Trials in the French Alps, and went down to the Motor Cycle Grand Prix at Le Mans. Whenever a racecourse or a reliability circuit has to be found, it is on a motor cycle that he sets out to explore; and, if the competitors find the course difficult, they, at any rate, know that it has been selected by a man with a practical knowledge of motor cycle events.

Really Severe Competitions for France.

Not only is the Union Motocycliste the controlling body, but it also organises some of the more important events in France. This year there are to be two outstanding competitions—the Grand Prix race at Le Mans on July 24th (which is a pure speed event) and the first non-stop reliability trial ever held in France.

We had the good luck to meet M. De Knyff just after he had discovered and tested the roads for the French non-stop trial of April 24th. "We have got to show that the motor cycle is a machine as reliable as any high-priced car," he declared, "and the best way to do this is to enter it into really severe competitions such as are common in England. The fact has to be admitted that in France we have neglected the motor cycle, and have allowed our neighbours to gain a lead on us. Now that there is a distinct popular movement towards the motor cycle and the cycle car, we must encourage it by organising events of a really sporting character, which at the same time will tend towards improvement in the quality of machines."

An Eight-hours Engine Test.

The first non-stop trial will be held in the Forest of Marly, about fifteen miles to the west of Paris, over a course roughly five miles round. While there is nothing of a really freakish nature in the set of roads, there are plenty of natural difficulties, including two hills with a gradient of 15%. The total distance will be about 155 miles; and, as the average of 18½ m.p.h. has to be maintained throughout, with penalisations for both early and late arrival, the engines will have to run for eight hours without a stop.

Although only short notice has been given regarding this event, M. René De Knyff believes that it will unite at least one hundred entrants with every type of motor cycle and cycle car. In order to encourage newcomers, and particularly amateur riders, the entry fee of one hundred francs is reduced to twenty-five francs for all those who received their competition licence after January 1st of this year. Entries are received by the Union-Motocycliste, in Paris, until the evening of April 20th. The first machines to be entered are four Nortons.

Round the Course of the A.C.U. One Day Trial.

A Sporting Day's Outing by Members of a London Club.

WITH a view to determining the severity of the trial arranged by the A.C.U., which is to be held on April 27th, a party of the City and Guilds Engineering College M.C.C. recently held a run round the course, as published in *The Motor Cycle* of March 24th. A dozen machines in all participated, and these consisted of very representative makes. A Harley, an A.B.C., a Triumph, two 2¾ h.p. New Imperials, a 2½ h.p. Clyno, and a 4 h.p. Douglas (two up), were the solo machines, while the sidecars included a Clyno and Enfield, and a 4 h.p. Blackburne, and lastly there was a sporting Morgan three-wheeler. As these machines range from a little two-stroke to a big twin, quite a good idea of the course from all points of view was obtained, especially when it is remembered that the roads were none too dry, and none of the machines were in any way tuned up for the occasion.

The Worst Hill in the Trial.

The start took place at Purley, whence the party proceeded through Caterham, and on turning to the left up a narrow lane encountered the worst hill in the trial, viz., Succumbe. On this, as on several other hills, there is an abundance of loose stones, and it is advisable to keep close into the side, for here a fairly reasonable surface may be found. On climbing this hill for the first time one is apt to imagine that one has finished the ascent when the first is surmounted, but as there is more to follow the "revs" must be kept up, though one should not overdo this, nor go too fast, as the corners are sharp as well as steep. Here the Enfield, Douglas, and Blackburne met their Waterloo, while a New Imperial rider broke his belt, but made a clean ascent after mending it. The Harley, the A.B.C., and the Morgan all made good ascents, the last-mentioned hurling stones all over the road, while the A.B.C. rider was so fast that he could barely take the corners.

Some of the Others.

The next hill likely to cause any trouble is Polesteeple. This was in a very slimy condition, and in consequence the Morgan, which, as usual, was no tortoise, had quite its full share of wheel slip. This and the Triumph streaked up side by side, but neither could gain a lead on the other. There was no actual failure here, though the Blackburne found it necessary to shed its passenger. The A.B.C. came up at speed, and the New Imperial ascended steadily with plenty in hand. Here as on most other hills, the best surface was at the side of the road, in this case on the right edge. Cudham Church Hill was the next hill of note, but did not cause a single failure, chiefly, no doubt, owing to the good surface and the lack of grease on the corner. Here the A.B.C. rider was too fast that even with cutting out he only just managed to take the corner. There was but one failure on Chalk Pit Hill, viz., the Clyno two-stroke, and here should be no difficulty experienced provided that the lower portion is not taken too fast, for here one may easily be baulked. At the commencement of the climb the A.B.C. decided that it preferred to be a single-cylinder rather than a twin, but notwithstanding it managed the gradient on its lowest ratio. From here onwards the course is perfectly straightforward, bar the ascent of Pebblecombe, which is a fairly long hill having a maximum gradient of about 1 in 4½. No difficulty, however, was experienced, though there is a sharp left-hand corner to be negotiated at the top.

At the bottom of Chalk Pit Hill, which is to be included in the A.C.U. One Day Trial on April 27th.

Altogether the A.C.U. has found a really sporting course which should provide a very fair test for standard machines, especially for new models chosen from agents' stocks.

As already stated, the trial is due to take place on Wednesday, April 27th, and is open to manufacturers, or agents, and private entrants, and will consist of a preliminary run round Brooklands of an hour's duration, in which six laps must be completed. This applies only to "standard stock machines" entries, and will not be required of all entrants.

Eighty Miles only on the Road.

There will next be a non-stop trial in two sections, of approximately forty miles each, beginning and ending at Brooklands, at a maximum speed of eighteen miles an hour, and a minimum speed of sixteen miles an hour. The arrival times will only be taken at the luncheon stop and Brooklands.

A non-stop speed trial will then be held on Brooklands track of twelve laps (32.6 miles). The following are the maximum rates of speed :

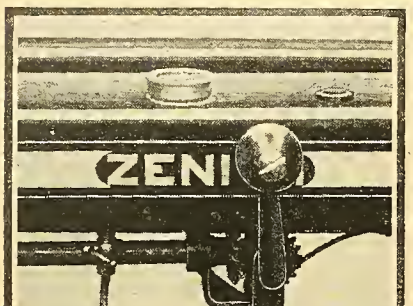
Class A, extended for the purpose of this test to machines not exceeding 275 c.c., and Class F, motor cycles with sidecars with engines of a cylinder capacity not exceeding 350 c.c., twenty-five miles an hour.

All other classes thirty-five miles an hour.

Motor cycles must be driven under their own power throughout the trial, and on the road must not be brought to rest under any circumstances except for the exigencies of traffic and at the controls.

Gear Ratios to be Published.

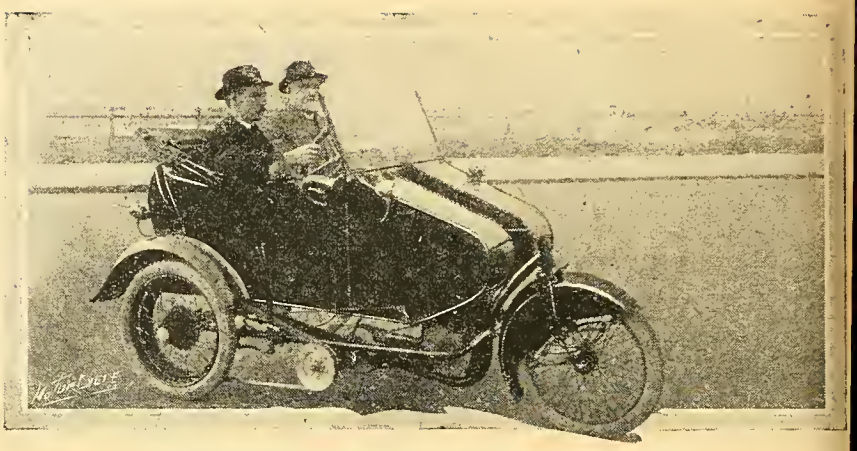
The gear ratio of every motor cycle will be published, and in the case of variable gears the highest and lowest ratios will be mentioned. The weights of the machines will also be published.



Motor cycles, sidecars, and cycle cars must conform to the F.I.C.M. regulations. Entrants of motor cycles conforming with the regulations and making a non-stop run will be granted a first-class certificate, and if, in addition to fulfilling these requirements, the motor cycle is a "stock" machine, the entrant will be granted a special certificate of merit.

Manufacturers who wish to enter a "standard stock machine" had to notify the A.C.U. to this effect before March 31st. They also had to authorise on a prepared form the officials deputed by the Competitions Committee to select the number of machines entered, which must arrive at Brooklands on Monday, April 25th, or Tuesday, April 26th. Stock machines were selected by the A.C.U. either from manufacturers or their London agents up to the date of the closing of entries, which was Saturday last.

On the morning of the trial these standard stock machines will be handed over to the accredited riders of the entrants, who will be allowed one hour on the track for making adjustments, during which six laps must be covered.

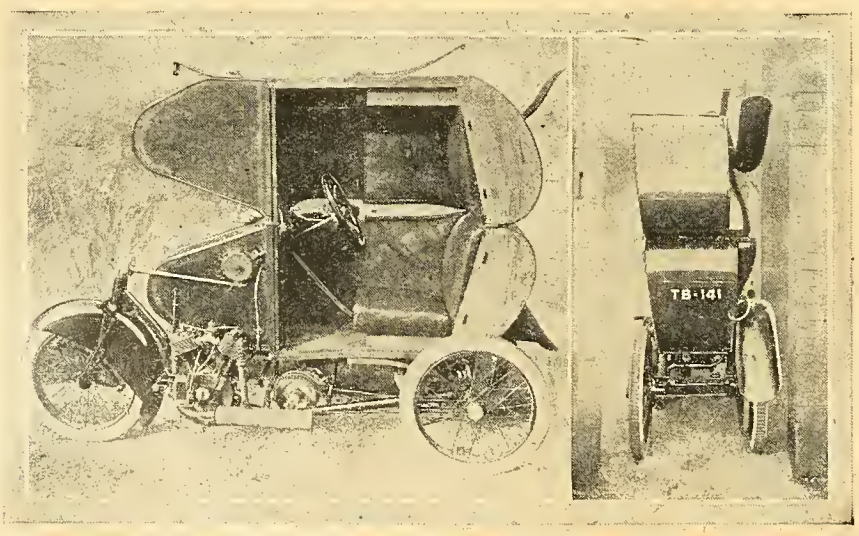


A GRADUA GEAR IMPROVEMENT.

AN innovation has been made in the design of the Zenith-Gradua gear by Mr. F. W. Barnes, chiefly for the convenience of those who drive fast, touring motor bicycles. It will be remembered that for many years the Gradua gear has been controlled by a handle fixed on a spindle running through the tank on the near side of the top tube. This has been a little awkward to manipulate at high speeds, and the new design has been got out with a view to overcoming this difficulty. From the accompanying illustration it will be noticed that the gear handle is on the

New gear control for Zeniths.

off side of the tank, and is designed to rotate at right angles to the direction of the original model. It would also be quite possible to run the horizontal spindle upon which the handle is mounted right across the underneath portion of the tank so that a handle might be fixed at each end, allowing the gear to be worked by either hand. It is the intention of Zenith Motors, Ltd., only to fit this new control to solo mounts, as the old system is quite adequate for sidecar machines.



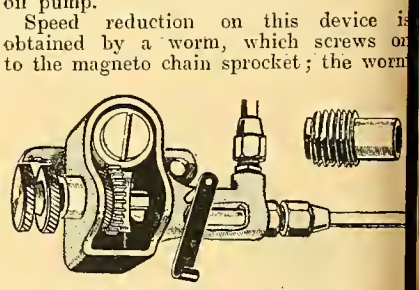
On the road in its natural form—the Dandy folding three-wheeler.

A FOLDING CYCLE CAR.

FOLDING or collapsible sidecars have been with us for some time, but a folding cycle car is, to say the least, somewhat of a novelty. Intended to meet the same contingencies as the folding sidecar, the Dandy three-wheeler has a V twin engine (a J.A.P. in the experimental model) mounted centrally behind the single front wheel; but the two-step transmission, including gear box, is entirely on one side of the chassis and drives one rear wheel only. The passenger's "compartment" of the body may be turned up over the driver's seat (as shown in one of the photographs), and the rear axle then telescopes inwardly, leaving the over-all width of the vehicle at 2ft. 8in. It is claimed that the folding process takes less than two minutes to complete.

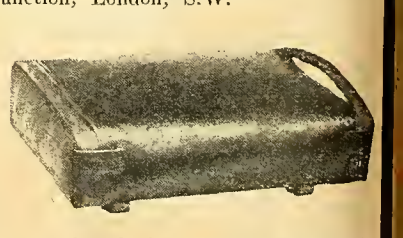
Also the subject of a patent, the front forks comprise a pair of full elliptic springs, which take the road shocks directly from the wheel.

James Sumner and Sons, the makers and designers, of 2, Latham Road, Portsmouth, hope to sell this cycle car with complete equipment at £220.



Broadside and rear views of the Dandy three-wheeler in its "folded" position, enabling it to pass through a very narrow gateway.

CONVERSION OF MECHANICAL LUBRICATION.



MECHANICAL lubrication seems slowly to be coming into favour, and, as a result, several oil pumps, easily adaptable to existing machines, are coming on the market. We illustrate a typical example, the Jebon mechanical oil pump.

Speed reduction on this device is obtained by a worm, which screws on to the magneto chain sprocket; the worm wheel, in turn, has a face cam which actuates a small plunger pump. Movement, controlled by an external milled nut, of the worm wheel on its shaft further serves to limit the throw of the plunger. Beyond the parts mentioned, which are comparatively few, there are only two ball valves.

This pump is made by the Jebon Press Works, 1, Brighton Buildings, Clapham Junction, London, S.W.

Jebon mechanical oil pump with the cover removed. (Inset) The worm, which screws on to the end of the camshaft.

Comfortable, handsome, and moderately priced (25/-) is the "Ideal Air Spring" pillion cushion, which, as the name implies, makes use of combined air and coil springing. The makers are Messrs. Saxessories, George Street, Coventry.

Disregarding Conventional Design.

A Swiss Motor Bicycle with Five-cylinder Rotary Engine in the Front Wheel.

WE have already published illustrations of the Megola motor cycle, and as it was made in Germany for a Swiss company we referred to it as a German production. We are now able to illustrate the 1921 model and to state that the design and capital behind the company are exclusively Swiss, the Megola S.A. being located at Zurich, and arrangements are in hand for the manufacture of the machine in various countries.

It may be recalled that the earlier model of this ingenious machine had the engine contained in the rear wheel, but in the 1921 type it forms part of the front wheel, which it drives through a train of gears; thus while the engine is rotating at one speed the wheel is revolving at another.

The bore and stroke of the five cylinders are 52 mm. and 60 mm. respectively, giving a total piston displacement of 640 c.c., and a declared 10 to 12 h.p. Lubrication is mechanical by means of a worm-driven piston pump.

Pressed Steel Frame Construction.

As will be seen, the frame is a pressed steel construction, with half-elliptic springs at the rear, and has a more or less conventional type fork utilising a leaf spring.

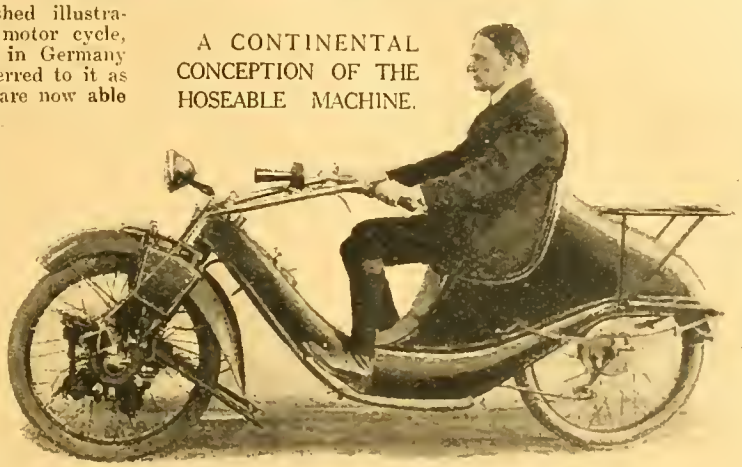
Having 28×3in. wheels, a long wheelbase, and somewhat narrow touring handle-bars, one cannot imagine such a machine becoming popular with trials competitors who take Porlock and Lynton Hills with their acute bends on the run. As a design, however, it is distinctly ingenious, and its appearance is bound to create much controversy. Still, we cannot mete out praise for the accessibility of the engine, the condition of which after a run in wet weather may easily be imagined.

Notwithstanding, it has points which in future years may become general practice. In this direction, one must admit that the clean outlines and provisions for protecting the rider from mud are excellent, and with an engine immediately in front of the rear wheel and a shorter wheelbase, it would possess a strong appeal to that large section of the riding public which still awaits the two-wheel automobile.

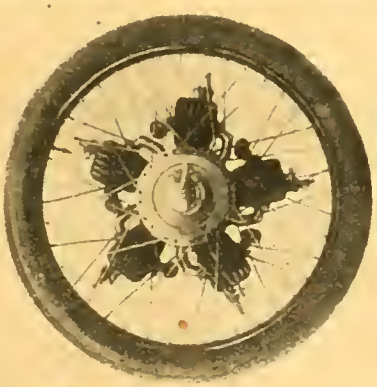
Those of our readers who have followed the controversy "Car Practice *versus* Simplicity" will probably take this as an example of how car practice may be introduced without undue complications. Undoubtedly the framework of the Megola is a cleaner piece of work than that of any other motor cycle, but this is only possible by adopting a far from ideal engine position.

Dismissing this interesting part of the Megola design, it will be seen that it would be extremely difficult to install an engine between the wheels and, at the same time, provide accessibility. One position, however, does suggest itself, *i.e.*, in that portion of the frame containing the tank. The imaginative motor cyclist will have no difficulty in deciding in his mind how a single-cylinder engine could be placed in an inclined position, with a gear box immediately behind it, and driving to the rear wheel in the more conventional way.

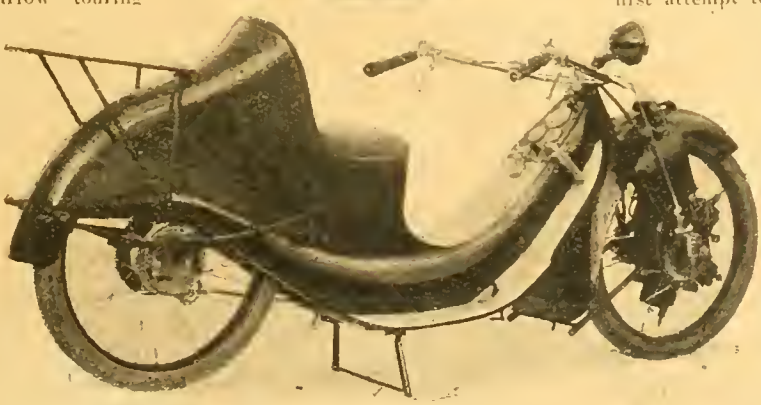
Attractions of the Open Frame.



This, of course, is not by any means the first attempt to market a motor cycle of this type. The Pullin is an excellent example, the Swan was another, and there have been others of a similar character, but, at the present time, not available to the buying public.



Fate seems unkind to the pioneer, and it would seem, in spite of the public's indictment that the modern motor cycle is the outcome of pedal cycle evolution—the buyer is extremely suspicious of all things that are born before their time.



At the same time, we await a road test of the Megola with great interest, particularly in regard to stability and the effect of the rotary engine upon steering.

We understand that the Megola is being exhibited at the Hague Motor Show.

A CONTINENTAL CONCEPTION OF THE HOSEABLE MACHINE.

(Top) The rider's reposeful position on the Megola is not one usually provided for solo riders.

(Centre) Having five cylinders, 52 mm. bore and 60 mm. stroke, the Megola engine revolves with the wheel but at a different speed.

(Bottom) The automobile dash and enclosed tank and framework will interest those who have followed the recent controversy in these pages on the relative advantages of car practice or simplicity. Here the two seem to be combined.

FULL RESULTS OF THE ESSEX OPEN HILL-CLIMB.

BELOW we give a schedule of the final placings (in the last column) and the formula and time results of the Essex M.C. open hill-climb on Kop Hill on Saturday, the 2nd inst. Gold medal winners are requested to inform the committee at once whether they wish to receive medals or silver ash trays.

Marlow and District M.C.C.

A visit was paid on the 3rd inst. to the quaint old town of Abingdon, and a most enjoyable afternoon was spent there.

Leicester and District M.C.

Last month the club had several runs, attracting an average turnout of about fifty members. On April 17th the first round of the Yates Trophy competition will be held.

Oxford M.C.

An attractive programme, including inter-club events with Banbury and Oxford University M.C.C. clubs, has been drawn up. Mr. H. M. Bailey, 43, Cornmarket Street, Oxford, is the hon. secretary.

Liverpool M.C.

Held on the 3rd inst. over a very sporting course, and attracting a large entry, a "surprise competition" resulted as follows: 600 c.c. Class.—1, N. C. Sclater (4 Norton). Unlimited Class.—1, E. A. Eastwood (7-9 American X).

Dublin and District M.C.C.

J. A. Carville, mounted on a 4 h.p. Triumph, has been adjudged the winner of the Easter reliability trial held under the auspices of the Dublin and District Motor Cycle Club. The lightweight prize in the competition was won by T. E. Green (2¼ Enfield). Gold medals were awarded to P. R. Hurse (4½ B.S.A.) and J. McEntaggart (7-9 Indian), as well as to the two cup winners.

North London M.C.C.

The results are now to hand of the Staley Cup Trial, held over an eighty miles course near Amersham. Mr. R. H. Baxter (2¼ Radco) was the winner, thereby gaining the Staley Cup and a gold medal. He obtained 100% of the marks allowed, and had 1½ min. error on time. Four other competitors gained 100% marks, and to each the club has awarded a silver medal. These were: Messrs. L. Walter (4 Triumph), R. R. Bowen (4 Triumph), R. L. Richardson (3½ Alecto), and Mrs. F. E. Jones (3½ Ariel). Six bronze medals were also awarded.

Norfolk M.C. and L.C.C.

Results of the hundred miles reliability trial at Easter have been announced as follows:

CLASS 1 (Solo Motor Cycles).—1, H. J. Hannent (4 Indian Scout), 2¾m.; 2, T. B. Hensman (4 Triumph), 3m.; 3, E. Edwards (6 Bat), 4m.

CLASS 2 (Sidecar Machines).—1, H. D. Wheeler (8 New Imperial sc.), 1¾m.; 2, A. Adcock (3½ P. and M. so.), 2¾m.; 3, C. W. Dix (6 A.J.S. sc.), 4¼m.

Cup presented by Mr. W. Lincolne Sutton for the best performance of the day.—H. D. Wheeler (8 New Imperial sc.).

Mr. W. Riley's prize for the best performance by a competitor not having held a driving licence prior to January 1st, 1919.—L. G. Baker (3½ 3rd M.).

Week-end Club Events.

April 16.—Stockport and District M.C. Remaining Classes of Open Hill-climb.
April 16.—B.M.C.R.C. Members' Race Meeting at Brooklands.
April 16.—Sunderland and District M.C. Consistency Hill-climb.
April 16.—Exeter M.C. and J.C.C. Opening Run. Chulmleigh.
April 16.—Oxford M.C. Half-day Reliability Trial.
April 16.—Helensburgh M.C.C. Hill-climb.
April 16.—Dewsbury and District M.C.C. Competition and Picnic.
April 16.—Bristol M.C.C. Reliability Trial to Torquay.
April 16.—Sunderland and District M.C.C. Hill-climb.
April 16.—Coventry and Warwickshire M.C. Manville Trophy Trial.
April 16.—Birmingham M.C.C. Novices' Trial.
April 16.—Kidderminster M.C.C. Social Run.
April 16.—West Kent M.C. Flexibility Test on Braxted Hill.
April 17.—Bradford M.C. and L.C.C. Speed Trial.
April 17.—Wallington and District M.C. and L.C.C. Reliability Trial.
April 17.—Eastbourne and District M.C.C. Hill-climb.
April 17.—Barrow and District M.C. Reliability Trial.
April 17.—Leicester and District M.C. Yates Trophy Trial (First Round).
April 17.—Sheffield M.C.C. Trophy Trial.
April 17.—Eastern Valley M.C.C. Social Run.
April 17.—East Lancs. M.C.C. Jerrard Cup Trial.
April 17.—Woolwich, Plumstead, and District M.C. Reliability Trial.
April 17.—Holwood M.C.C. 100 Miles Club Run.
April 17.—Newcastle and District M.C. Hill-climb.
April 17.—Leeds and District M.C. Club Run to Askham Richard.
April 17.—Halifax and District M.C.C. Club Run to Sprotborough.
April 17.—Ilkeston and District M.C.C. Club Run to Alport.
April 17.—Manchester M.C. Speed Trials.
April 17.—Essex M.C. Captain's Surprise Run.
April 17.—Eastbourne and District M.C.C. Hill-climb.
April 17.—Ivy M.C.C. (Wolverhampton). Club Run to Malvern.
April 17.—Reigate, Redhill, and District M.C.C. Speed-judging Contest.
April 17.—Horsham M.C. and L.C.C. Reliability Trial.
April 17.—Liverpool M.C. Amateur Trial for Blake Cup.
April 17.—Portsmouth and District M.C. and L.C.C. Club Run.
April 17.—Leeds M.U. Club Run to Bishop Monckton.
April 20.—Harrogate and District M.C.C. Social Run.
April 20.—Plymouth and District M.C. and L.C.C. Paperchase over Dartmoor.

IMPORTANT club and OPEN events are tabulated on the "Questions and Replies" page.

Stourbridge M.C.C.

In glorious weather a muster of fifty-two started from headquarters on the Captain's run for Flagstaff Hill, on which an impromptu climb was held. B. Clare (3½ Norton) was the winner.

Bridgwater and District M.C. and L.C.C.

On Saturday, April 30th, the club is holding an inter-club hill-climb at Puritan Hill at 3 p.m. This event is open to all West of England clubs. The course is a measured half-mile and of excellent surface, and it is hoped that as many members as possible from the neighbouring clubs will compete. Full particulars and entry forms may now be obtained from the hon. secretary, Mr. J. W. Hooper, the Oaks, Wembdon, Bridgwater.

Reigate, Redhill, and District M.C.C.

Including Chalk Pit Hill, a course in the Westerham district did not prove difficult to the majority of the competitors in a reliability trial held at the beginning of the month. Many were too early, however, and the following are the only awards to be made. Gold medal.—R. Green (4 Norton). Silver medals.—H. Watkins (8 Matchless sc.), J. Duplock (3½ Sunbeam sc.), and L. Alderton (4¼ B.S.A.).

Ilkley M.C. and L.C.C.

G. Clapham, of Keighley, on a Scott Squirrel, made a very successful performance in the reliability trial organised by the Ilkley Motor Cycle and Light Car Club on the 3rd inst. Over a route of ninety-nine miles across the upper reaches of the Yorkshire dales, with eighteen checks, and to a timetable worked out at 20 m.p.h., he lost only 15s. Twenty-four competitors took part. The winners were as follows:

Founder's Trophy and gold medal, G. Clapham (3¾ Scott Squirrel), total error 15s.; silver medal, B. H. Voss (3 A.B.C.), 6m.; bronze medal, C. A. Barker (6 Enfield sc.), 10m. 28s.

Rugeley and District A.C.

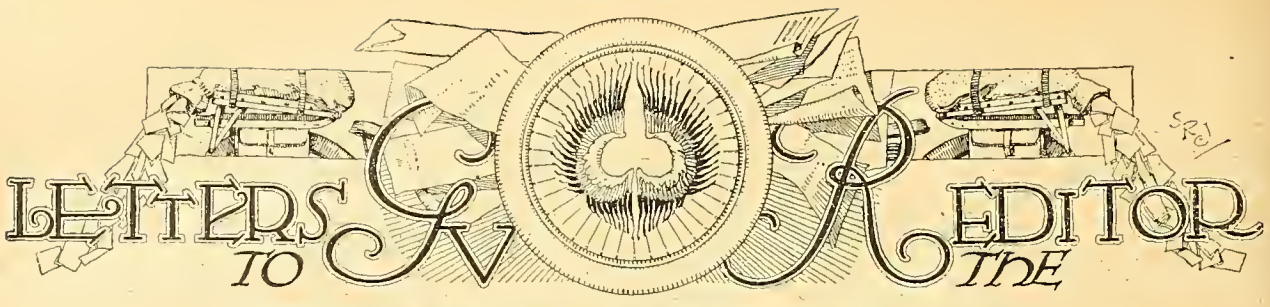
Detailed results of the speed trials held at Ingestre Park on Easter Monday, by permission of the Earl of Shrewsbury, are as follows:

300 c.c. CLASS.—1, P. F. Griffin (2½ Levis), 22⅘s.; 2, E. K. Griffin (2½ Levis), 24s.; 3, C. E. Massey (2½ Edmund-Union), 28⅘s.

350 c.c. CLASS.—1, E. Smith (2¾ Douglas), 19⅘s.; 2, N. Craddock (2¾ Douglas), 21⅗s.; 3, P. F. Griffin (2½ Levis), 22s.

500 c.c. CLASS.—1, W. Penn (3½ Rudge), 21s.; 2, P. F. Griffin (2½ Levis), 21⅗s.; 3, N. Craddock (2¾ Douglas), 23s.

680 c.c. CLASS.—1, B. Moakes (3½ Norton), 19s.; 2, N. Craddock (2¾ Douglas), 20⅗s.; 3, P. F. Griffin (2½ Levis), 21⅗s.



UNLIMITED.—1, E. Smith (2¾ Douglas), 18⅗s.; 2, W. Penn (3½ Rudge), 19⅗s.; 3, B. Moakes (3½ Norton), 20s.

South-west Durham M.C.

Thirty-four competitors started in the Easter Monday reliability trial, which was held under extremely adverse weather conditions. Rain and snow had made the surface of Killhope, the observed hill, very soft. Among those to make clean ascents were: G. Hudson (6 Matchless), J. Fidian (4 Triumph), J. P. Bell (3 A.B.C.), T. Scaife (4 Norton), A. Collingwood (3½ Norton), J. Grieves (4 Norton sc.), G. Walker (Morgan), A. Purvis (6 A.J.S. sc.), H. J. B. Murray (3½ Rover sc.), A. Wainwright (4¼ B.S.A. sc.), and E. Walsh (4 Norton sc.). Results (showing marks lost):

PASSENGER MACHINES (UNLIMITED).—Gold medal, E. Welsh (4 Norton sc.), 0; gold medal, E. Purvis (6 A.J.S. sc.), 0; silver medal, H. J. B. Murray (3½ Rover sc.), 6; bronze medal, A. Wainwright (4¼ B.S.A. sc.), 11.

SOLO MACHINES (UNLIMITED).—Gold medal, A. Scaife (4 Norton), 2; silver medal, J. P. Bell (3 A.B.C.), 3; bronze medal, A. Collingwood (3½ Norton), 4.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

HARD ON THE DOG!

Sir,—You may be interested in my method, which has effected a permanent cure of the dog nuisance.

On the dog making his usual frantic rush he should not be discouraged, but invited to continue his gambolings alongside. The throttle is opened gradually and the playful puppy (noisy end) manœuvred into the vicinity of the exhaust pipe (business end). The desired result being obtained, the "P.P." will decelerate violently, and will be seen showing obvious symptoms of acute nasal disturbance and pending gastronomic eruptions. G. A. OWEN.

SIDECAR OR CYCLE CAR?

Sir,—Like many hundreds of your readers, I especially enjoyed your article on "Sidecar or Cycle Car." As a solo rider, I am trying to make up my mind whether to join the sidecarists or cycle carists for the coming season. It is evident there is little to choose between a first-class sidecar outfit and a first-class runabout as regards initial cost and general reliability. What I would like to see is a comparison as regards cost of upkeep, including petrol, tyres, and replacements. It would appear that repairs, being more on car lines than on the runabout, would be somewhat higher than on the sidecar outfit. I would also like to know how they compare for average speed or runs of over 100 miles. Perhaps some reader would enlighten me. TYRCONNELL.

Ireland.

CLASSIFYING COMPETITION RIDERS.

Sir,—"Etaples's" letter in your issue of March 17th is excellent, but I would go a little further, viz., "star" the trade rider, "dagger" the man in the "expert" list, and put some other fearsome sign to the man who has a trade interest in the machine he is riding.

Good luck to them all, anyhow. I have just recovered from the latest form of secret check—to wit, a trenched road. A.C.U. please note. B. (Capt.).

Co. Kildare.

Sir,—With reference to remarks by "Etaples" in *The Motor Cycle* of March 17th regarding amateur and professional riders in competitions, I should like to say I entirely agree with his suggestion that there should be some means of identifying an amateur from a professional.

I should also like to point out that in most events the amateur rider is practically barred, having to compete against professionals with a factory behind them.

I feel sure that if the clubs were to make two premier awards—one for the professional and one for the amateur—they would increase their membership. Also, the clubs in which the suggestion was carried into effect would be more sociable and quite as sporting.

Take an amateur rider, for instance, who joins a club and fancies himself on the local hill. He pays his fee, tunes his machine to the best of his ability—probably in the kitchen, if the family will stand it—and goes to the hill-climb or speed event. What has he to compete with? Special engines, aluminium pistons designed with a compression ratio just suitable for the competition, and other tricks of the trade, which, possibly, would not stand a short tour, and would be hopeless in traffic. What earthly chance has he? He goes home disgusted with his machine, which is probably as good as the average.

I say again, and I know lots who will agree, give the amateur with a standard machine a chance.

Birmingham. FAIRSPORT.

Sir,—I note with interest the remarks of your contributor "Etaples" on the classifying of competition riders.

I am connected with the motor trade, from which I get my living; but when I ride in, say, a hill-climb or speed event on a Saturday afternoon I do so at my own expense and from a sporting point of view in the same way as a man connected with any other trade might do, and I should not care to be called a trade rider.

I should like to hear your correspondent's definition of an amateur rider, as there must be a good number like myself who ride for the sport but who are connected with the trade.

E. C. COLLINS.

NOT ENOUGH MUD TO WORRY ABOUT.

Sir,—Being another appreciative reader of your paper for many years, I should like to state that "Opinion's" letter was indeed very refreshing.

I am an all-round rider, and, being in business, my runs are confined to fixed days with an occasional day off. I am not concerned much with the weather. My 'bus is an Enfield Six, well mudguarded. My wife occupies the sidecar, with an Easting for protection, and myself in warm rainproof Beacons. So equipped, mud and rain are secondary considerations, and I am always surprised after every muddy and wet ride how clean my overalls are, with no spots save on my boots. The Easting keeps my passenger absolutely dry. My car friends often point out to me the comfort and cleanness of car driving. Admitted, but give me the sporting cycle. Incidentally, we cannot all afford cars.

D. C. WILLIAMS.

INCREASING SEATING CAPACITY ON THREE-WHEELERS.

Sir,—May I venture to suggest that one of the great disadvantages of the runabout, *i.e.*, its inability to carry more than two people, might be overcome by fitting two small seats on each side of the rear wheel and enclosed in the mudguard? These seats would of necessity be small, but they could be made sufficiently large to accommodate a child up to about fourteen or fifteen years of age; while, by removal of the cushions, ample and convenient luggage space would be available.

These seats would naturally make the mudguard so wide as to make the wheel very inaccessible. However, by removing the seats, and by hinging the rear portion of the mudguard as on the T.B., this would be completely overcome. D. CLARK.

DEFINING "SILENCE."

Sir,—I have read with interest a letter on the above subject, signed E. E. Howell, and published in your number of the 24th March, and venture to offer my solution to this problem, speaking as one who has studied human nature.

I would advise all those concerned with such an act of tyranny on the part of a local magistrate to form themselves into a league, to be known as "The Society for the Protection of Long Exhaust Pipes," and to present him with a motor cycle, fitted with a two-and-a-half foot, well polished copper exhaust pipe; together with a good leather and a tin of Brasso.

I would predict that all trouble with the authorities in this direction would immediately and mysteriously cease.

I am, of course, neither a manufacturer of motor cycles with long exhaust pipes, nor am I a magistrate, but am merely writing as A PSYCHOLOGIST.

Putney.

GOOD SAMARITANS.

Sir,—Will you kindly find room for a letter of heartfelt thanks to the two sportsmen who stopped to help me when stranded between Lancaster and Preston on the evening of this atrocious Easter Monday. The exhaust valve of my machine had broken, and my wife in the sidecar was taken ill. We were about eight miles from anywhere; it was raining persistently, and we (and our helpers) were soaked.

I had done some ninety-six miles (rain all the time), and had battled, with a slipping belt, against the storm for thirty of them, when the valve went. I was fagged and very anxious about my passenger, and still twenty-eight miles from home. These fellows, in spite of having been some eighteen hours on the road the day before owing to a sheared key, stopped willingly, and one on a 4 h.p. Triumph (I think, for it was dusk) towed us into Preston over appalling roads, and went out of his way to get us to a garage near the station. I will only say that the best "Get you home scheme" is, in my opinion, the British sportsman.

A. G. BANKS, Lieut. R.E.(T.).

POINTERS IN RADIAL ENGINE DESIGN

Sir,—As an engineer having considerable experience in the design and manufacture of radial and other engines for aero and general work, including the Redrup three-cylinder radial engine for motor cycles, I venture to raise a few points briefly in connection with the proposed design of a three-cylinder radial described in *The Motor Cycle* of March 10th. It should be borne in mind that my criticisms are based upon the present design, which may not of necessity be the final form.

It is noticed that the exhaust passages are in one with the gear case attached to the crank case. This appears very undesirable, as in a radial engine, even though the heat from the cylinder be dissipated as rapidly as possible, the crank case tends to become hot with conducted heat, and the casting of the exhaust passages with a portion of the engine bolted directly to the crank case would be distinctly unsuitable.

The extreme distance between the bearings supporting the crankshaft would create a strong tendeucy to crankshaft whip which would impose considerable strain on the crank pin joint, have a disastrous effect on the ball bearings as arranged, and the whip of the shaft would set up a cantilever action upon the two bearings nearest to the flywheel.

The segmental design of connecting rod end would be found to be quite unsuitable in practice in a comparatively high speed engine, as on account of the limited width of the "feet" (having three on a common bush) a severe binding effect would be set up in the housing.

The design of the detachable cylinder heads does not seem to be good, as there would be a somewhat large unsupported area which would provide a fruitful source of warping and leakage in practice.

The valve gear is unnecessarily complicated, and entailing, as it does, six spur wheels and accompanying mountings, it would probably be found to be noisy unless very carefully constructed. The mounting of the complete engine in the frame is very crude, as there is a lot of overhang, though this, together with other details mentioned, may receive further attention at the hands of the designers before the proposition assumes practical shape.

C. B. REDRUP.

LINCOLNSHIRE AS A TOURING GROUND.

Sir,—I was extremely interested in "Friar John's" article in *The Motor Cycle* for March 17th on the beauties of Lincolnshire, probably because I am a "Johnny of the Wolds" myself, and, so, well acquainted with the places mentioned in his article. He bears out what I have always maintained, that few, if any, counties in England are able to offer such a delightful variety of scenery as Lincoln.

The Fens may appeal to many, but, to me, from a touring point of view, they offer no comparison to the Wolds. It would certainly be a revelation to many persons to make Spilsby or Horncastle their headquarters, and to tour thoroughly the neighbourhood. We have very few roads to satisfy a speed merchant: the surfaces are just now rather rough, but pot-holes are conspicuous by their absence. The more enjoyable rides are off the beaten track and well away from the towns. Amongst the Wolds proper practically no level road is encountered. Windiug lanes, shady dells, rippling brooks, the unexpected climb, all add zest and pleasure to such a trip, and are, in variety, enough to please the most exacting. Many of the climbs bring into use the low gear of a sidecar, but although a good test, none are beyond the capabilities of a decent "3½."

The views from selected spots are nothing less than magnificent, especially those overlooking the Fens. From a hill in our own village, on a clear day, Lincoln Cathedral, Boston Stump, Tattershall Castle, the sea at Skegness (distances varying from fifteen to twenty-seven miles) are easily visible.

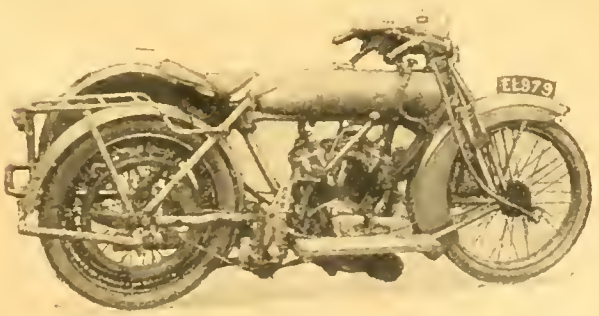
We, too, are interesting historically. Tennyson's birthplace at Somersby, Sir John Franklin at Spilsby, Henry IV. at old Bolingbroke, Tattershall Castle, Revesby Abbey, and other places are all within easy distance. The churches, too, are worth visiting. I am told part of our village church is over 1,000 years old.

It may be interesting, too, to know that this village is mentioned in Doomsday Book, and that in the church register is an entry which is supposed to have been made by a follower of Cromwell, who turned out the then incumbent. It is probably true, for in 1643 Cromwell met at Wrawby (two miles away) the Royal Army, which was marching to relieve Bolingbroke Castle, but the Royal Army suffered a disastrous defeat; the scene of the encounter is still named Slash Hollow. In Horncastle Church are displayed old weapons which are supposed to be relics of the encounter.

Anyone desiring a truly rural picnicking tour, a holiday amongst the Wolds could not fail to be appreciated, and a description of such a tour from the pen of a ready writer such as "Friar John" would be an interesting addition to your always interesting journal.

C.E.D.

Spilsby.



MODERNISING AN OLD MACHINE.

Sir,—Referring to your article on converting old machines, I have pleasure in enclosing herewith photographs and particulars of a rather interesting conversion I have carried out for a friend of mine on a 1914 Bat-Jap sidecar outfit fitted with hub gear.

This hub gear was not very satisfactory, and it was decided to replace it with a new up to date gear box with clutch and kick-starter, arranged for chain and belt drive.

The box which appeared most suitable was the Juckes patent countershaft type. This has several good features, which make it rather suitable for the purpose in view.

The gear lever and gate are attached to the box itself, and cannot easily get out of order, there being no tank fittings or rods of any sort requiring adjustment.

Converting a 1914 Bat-Jap to a countershaft model. (See letter from Mr. W. Gwennap.)

In fitting the gear box to the horizontal stays, it was found necessary to remove the latter, and make them parallel by heating, so as to receive the gear box, the box then being secured by four ⅝in. studs tapped into a specially thickened part of the stays. Transmission is by ⅝in. × ⅜in. chain, and thence by 1in. belt to a new rear wheel, top gear being about 4 to 1.

Two brakes are arranged to operate on the rear wheel, and the clutch is a massive cone type, and operated from the handle-bars with perfect ease.

It will be noticed from the photograph that there is an entire absence of change-speed brackets and rods, giving the cycle a clean appearance. The total cost of the whole job was approximately £37, not allowing anything for the parts removed, some of which have a marketable value.

W. GWENNAP.

UPPER SWALEDALE IN THE LONDON-EDINBURGH.

Sir,—I gather from the sketch map in *The Motor Cycle* that the London-Edinburgh Whitsuntide route, after crossing the Buttertubs, continues through Upper Swaledale *via* Thwaite and Keld to the Pennine watershed at Hollow Mill Cross, thence dropping into Kirkby Stephen by Nateby. Has this section been included in any previous important trial? My recollections of it date back to several pre-war tramping tours, and unless memory plays me false there were then "umpteen" miles of unrolled metal east of the summit. Can any of your readers give up-to-date information as to the condition of this section from the sidecar point of view? It lies over magnificent moors, flanked on the south by Great Shunnor Fell, and in clear weather the steep descent to Nateby provides fine panoramas of Westmorland. DALE LOVER.

WE STAND CORRECTED!

Sir,—Until to-day, I have always read your paper with great interest and instruction. But I find you have misled me. Your ideas of what a sporting motor cyclist should be have been wrong. Now I to-day have seen the ideal sportsman—two of them, in fact, and I can assure you that we benighted bumpkins in our town are not a little pleased with ourselves. This pleasant Sunday afternoon I was abruptly awakened from my snooze by the sound of fifty million aeroplanes, and, on rushing to the window, I saw a solo big twin and another with a light sidecar hurtling along on bottom gear on the level at 6 m.p.h. easily. The superdrivers on them had removed the silencers, and were alternately opening and shutting the throttles. You may guess I was open-mouthed with admiration at this pluck and skill. The riders were also good enough to tour even the side streets—no favouritism about them. I afterwards saw these supermen outside the inn of their choice smoking cigarettes, yes, and blowing the smoke through their noses!

Last August I saw T. C. de la Hay, Eric Williams, George Dance, and other moderate riders go through the town with no more noise than you or I make, *en route* in the Six Days. And yet you have taught me to look on them as crack riders. No, sir, winning the T.T. is all right in its way, but give me the man who takes off his silencer on a Sunday afternoon, and can accelerate up to 5 m.p.h. on low gear in next to no time in a quiet street.

Northallerton. J. LLEWELLYN G. HILL.

WAS IT ENGINE SEIZURE?

Sir,—I was much interested in reading "F.L.S.'s" letter regarding the apparent seizure of the engine of his 4 h.p. Triumph, as a similar experience befell me last Thursday.

My machine is a 1919 4 h.p. Trinmph, solo.

I had covered about fifty miles on a run to Penzance, and was travelling at thirty-five miles an hour, when my engine suddenly stopped, bringing my bicycle to an abrupt standstill and nearly throwing me out of the saddle.

Finding the engine rather hot, I gave it two pumpfuls of oil, and it re-started after a couple of good kicks, and appeared to be in splendid fettle.

I remember having a similar experience some months ago, but could find no reason for the apparent seizure, as I habitually over-oil. GEO. LAITY.

Sir,—Your correspondent "F.L.S.," in your issue dated March 31st, seems to have over-oiled and produced seizure of a valve stem, which latter, on cooling, would free itself and show little trace of the trouble. I have experienced the same trouble on a Douglas, and give the suggestion as a possible cause. Of course the skirt of the passenger's trench coat, or skirt *tout court*, might have wound itself into the works.

Wallington. AJ 1.

Sir,—I was very much interested in the letter by "F.L.S." about partial engine seizure.

Without presuming to have much knowledge of engines and their peculiarities, I may, through my own experience, be able to give "F.L.S." some information which will perhaps enable him to trace the trouble.

My own 1920 Triumph runs faultlessly until I open "all out." It will exceed 50 m.p.h. comfortably, and has touched 58 m.p.h., but if I run at this speed for more than half a mile the engine locks without warning and the machine comes to a standstill. Strangely enough, it will start again immediately, by applying the kick-starter.

For some months I was unable to fathom this until I examined the piston and cylinder closely. I found at the head of the piston a very slight score and a stain of brownish tinge (obviously a burn). The cylinder wall has a corresponding, but much less visible, stain, running vertically in the path of the piston scoring.

I have concluded that this is caused by a gas leakage as a result of the first partial seizure, which, no doubt, was caused by myself in ignorance by under-lubrication at speed.

If "F.L.S." will examine his engine, he will no doubt find similar markings to those I have mentioned, which were evidently there before he used the machine, and, therefore, no matter how much oil he injected at speed the leakage down the piston side would, after a few minutes' running, result in a "dry up." CHAS. G. HOUGH.

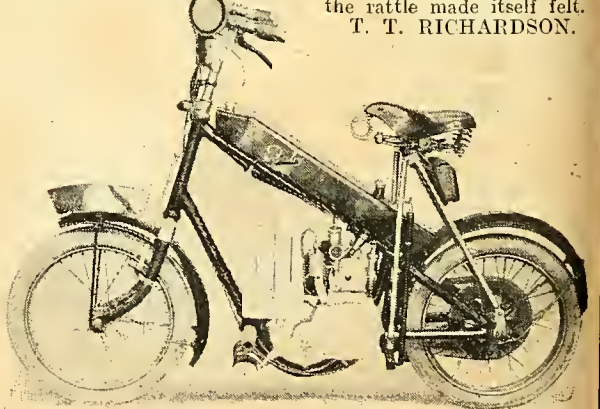
Sir,—May I venture to add my experiences to those of your correspondent "F.L.S."?

I have had apparent seizure three or four times with a scooter (pump lubrication). On one occasion I had injected two or three pumpfuls of oil before starting, and had not gone far when, without warning of any kind, the back wheel locked. However, I was able to start again immediately, and the machine ran for the rest of the journey faultlessly. I know the oil reached the engine all right, because it smoked furiously on starting, and had only just left off smoking when this occurrence took place.

This puzzled me so much that I gave up trying to fathom the mysteries thereof, when, on seeing your other correspondent's description of his joys, I was encouraged to add mine.

Perhaps "Ixion" can help us out on this point. Really, he is as faithful in feeding us, his sheep, with his incomparable "comments" as any parson is in supplying his flock with sermons, and "Ixion's" parishioners are many and varied—at least, round this district. D.J.E.

Tunbridge Wells.



Sir,—The experience which "F.L.S.," of Derby, relates is almost a parallel to my own. Riding a 2¾ h.p. New Imperial, I was having a friendly "scrap" with another outfit when my engine stopped dead, locking the wheel, but, before the machine came to a stop, freeing itself again. I had closed the throttle on the engine stopping, but on opening up the machine went off again, apparently O.K.

The sequel came some time later, when the engine developed a most disconcerting rattle when running "light." Thinking that it was due to wear on the big end, I dismantled the engine, and found the bush seized on to the crank pin, and the whole moving inside the end of the connecting rod.

I had the connecting rod rebushed, and have had no trouble since.

I attributed the stoppage of the engine to the seizing of the bush, and then the pressure on the engine sprocket must have been sufficient to free the whole inside the connecting rod. I may remark that the engine ran perfectly for about 200 miles before the rattle made itself felt.

T. T. RICHARDSON.

For sale at the Crystal Palace Second-hand Show. A Max miniature, of the type exhibited at the Stanley Show of 1908, built before designers had such high hopes of producing what might be termed the "missing link" between motor cycles and scooters.

ORGANISATION AND CO-OPERATION.

Sir,—With reference to Mr. Loughborough's letter indicating what is and has been the attitude of the A.C.U. towards the new scheme of taxation, I hasten cordially to endorse his statement concerning the co-operation existing between the A.C.U. and the A.A. The letter which drew Mr. Loughborough's perfectly fair reply unfortunately escaped my notice; otherwise I should have written at once to correct the statement made by your correspondent.

Immediately the horse-power tax proposals were known, and the Motor Legislation Committee got to work, the A.C.U., with ourselves and other organisations represented on that committee, realised the injustice of the proposals and united in opposing the tax. STENSON COOKE.

Secretary the Automobile Association and Motor Union.

SPLITTING HAIRS?

Sir,—I should like to congratulate Mr. H. L. Lewis on his super-mathematical mind! When he mentions such things as "$y = e^{ax}$ (or $y = \frac{dy}{dx}$, which is the same thing)," I shudder.

If he can prove this to me I shall be pleased to forward him a bag of nuts. I am fairly conversant with the calculus, but I always thought that $\frac{dy}{dx} = y$ only when $y = ae^x$. Also, Mr. Garrod is perfectly justified in using the multiplication sign "×," since it is the one used at schools, and thus possibly the only one known to those with less brilliant intellects.

W. N. G. PHILLIPS.

Sir,—In your issue of the 31st March, Mr. H. L. Lewis has made a fairly good attempt to show his superiority over us, —mere motor cyclists, in elementary calculus.

However, may I be permitted in the interests of those of your readers who are studying this interesting branch of mathematics privately to point out an obvious "howler."

Mr. Lewis says: ". . . $y = e^{ax}$ (or $y = \frac{dy}{dx}$, which is the same thing) . . ." Surely if $y = e^{ax}$, $\frac{dy}{dx} = ae^{ax}$. I believe this is a "standard form." However, not being a mathematician I am open to criticism. From these last statements it is obvious that $y = \frac{1}{a} \cdot \frac{dy}{dx}$.

So Mr. Lewis's little example of "higher mathematics" was "but a meaningless assemblage of three or four letters of the alphabet" after all! H. H. C. BARTON.

THE BALANCE OF MOTOR CYCLE ENGINES.

Sir,—It appears to me that Mr. T. S. Bentley is at fault in his remarks on the above, concerning static and dynamic balance. Although static and dynamic balance are essentially different, it is easily shown that the necessary conditions for one satisfy the other. The accompanying diagram explains my argument.

Let M and m be two masses revolving about a fulcrum F, their radii and velocities being respectively Rr and Vv. The condition for static balance is—

$$m \times r = M \times R. \quad (1.)$$

The condition for dynamic balance is—

$$\frac{mv^2}{r} = \frac{MV^2}{R}. \quad (2.)$$

Now let w be the angular velocity, then $v = wr$ and $V = wR$.

∴ (2) becomes $\frac{mw^2r^2}{r} = \frac{Mw^2R^2}{R}$, or $mr = MR$, which is identical with (1).

We therefore see that an arrangement giving a static balance gives dynamic balance at all speeds.

S. W. FARRINGTON, A.M.I.C.E.

Sir,—In your issue of March 3rd I am aware Mr. T. S. Bentley in his remarks on the above is confusing centrifugal force and kinetic energy.

It is the former which is made use of in balancing an engine, and this quantity does *not* vary directly as the square of the velocity. For instance, the value for a weight of 10 lb. at a 2ft. radius is exactly the same as for one of 5 lb. at 4ft. radius, in both cases revolving at the same number of revolutions per second. Other considerations apart, it does not matter what is the radius of the centre of gravity of the balance weight compared with the radius of the crank pin provided the weight is made proportional to the radius in accordance with the well known formula for centrifugal force.

It appears to me that if Mr. Bentley were correct in his argument we should be under the awkward necessity of wanting a different balance weight for each and every speed at which the engine was run. I would cite as an example the modern locomotive. It is unlikely that the designers of this type of prime mover (which is very sensitive at high speeds to conditions of bad balance) would continue to put their weights on the wheels at anywhere from two to four times the radius of the crank, when, if it were absolutely necessary, they could be affixed to the crank web ends quite easily, at a radius closely approximating that of the crank pin. H. H. BEAUCHAMP, M.I.A.E.

FOUR-STROKING.

Sir,—Having read the letters on cures for four-stroking in two-strokes, may I suggest the following remedy which I have found satisfactory for the past five years?

Buy an ordinary gas tap from the nearest gas office, bore a hole in the induction pipe (opposite the induction port) sufficiently large to take the tap, fit it, and keep it open as much as the engine will allow.

It will not only stop four-stroking, but increase m.p.g., to say nothing of speed. A.N.

Taunton.

SUMMARY OF CORRESPONDENCE.

Several further correspondents in the Bromley district complain of "silence troubles" with the police.

Under the heading of "Three Thousand Miles on a Solo Big Twin," "Con Rod" states the case for that type of mounting. His own 6 h.p. Zenith has a speed range of 4½ m.p.h. to 57 m.p.h., and has averaged 92 m.p.g. for more than a thousand miles. Comfort and low tyre wear are other points emphasised. A Binks carburetter is also given its share of credit for the flexibility and low fuel consumption of this mount.

Referring to "Ixion's" query as to where the old "scooters" are nowadays, "F.J." informs us that he has used a Skootamota for the last twelve months with every satisfaction.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	Book post.
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A system for tracing motor cycle faults and of remedying them when found. Fourth Edition ..	2/-	2/3
"MAGNETOS." By A. P. Young. A complete treatise on magneto ignition for motor cars motor cycles, and aeroplanes. Second Edition	4/6	4/10
"TWO-STROKE MOTOR CYCLES." A reliable treatise on Two-strokes, from the rider's point of view. Just published	3/-	3/3
"MOTOR CYCLE REMINISCENCES." By "Ixion," of *The Motor Cycle*	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS, England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District ..	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

RUNNING-IN A TWO-STROKE.

I have recently purchased a machine with a Villiers 2½ h.p. engine, and would like to know: (1.) The usual mileage per gallon of this type. At present all I can get out of it is from 60 to 70 m.p.g. (2.) It is lubricated on the petroil system. What is the quantity of oil per gallon to ensure perfect running and lubrication? (3.) Shall I get better results after the engine has been run in (it is new)?—H.G.J.

(1.) About 70 to 90 m.p.g. (2.) The proportion of oil to petrol is one in twelve at first; later, it might be cut down to one in sixteen. (3.) No doubt the engine will improve both in power and consumption after it is thoroughly run in.

GEAR RATIO FOR LOW-SPEED ENGINE.

Having built a motor scooter (with chain drive), I should like to know how many teeth are needed on the engine sprocket, also back wheel sprocket, to get 25 m.p.h. The engine is a 3½ h.p. Minerva (1,800 r.p.m. normal), and the wheels are 24×2in.?—W.T.

You would need a gear of about 5¾ to 1, and if you have only one chain you will need sixteen teeth on the engine shaft, and ninety-two teeth on the back wheel, or you can use fourteen teeth and eighty teeth. Such a large reduction in one step is not advisable, and it would be better to incorporate a countershaft when you could have sprockets as follows: Engine shaft fourteen teeth, countershaft thirty teeth, final drive sprocket on countershaft fifteen teeth, back wheel forty teeth.

BURNT EXHAUST VALVES.

Just recently my 1919 4 h.p. Triumph began to burn up exhaust valves at an alarming rate. In thirty miles a new exhaust valve drew out nearly 1/8in., and had obviously been red hot. The carburetter is a Binks, giving, if anything, a weak mixture, spark well advanced, tappet correctly adjusted, engine otherwise running well. I should be glad of your advice.—H.B.H.

You do not say whether any change has been made in any of the adjustments coincident with the burning of the exhaust valves. It is obvious that some change has taken place if the machine has only recently developed this trouble. If the mixture is noticeably weak, you may expect overheating as a result. Also verify the ignition timing. The contact breaker points should separate when the piston is on top dead centre (with magneto control two-thirds retarded).

DRAINING CRANK CASE.

(1.) As there is no drain tap on the bottom of the crank case of my machine, would you suggest the easiest method of draining off the used oil? (2.) About how often would this be necessary? I have once taken out the screw from the crank case to drain off this oil, but this necessitated removing the silencer and footboards. (3.) My engine will not kick start from cold as it used to; if run down a hill in gear, when the exhaust lifter is dropped it will fire fitfully, but as soon as it is warmed up it will run quite normally. Would a worn out plug cause this?—T.H.N.W.

(1 and 2.) The only method is by removing the plug you mention which is already provided in the bottom of the crank case. Although it is advisable to drain out the used oil at intervals, it is not absolutely necessary, and many riders omit this attention. (3.) You do not give the age of your machine, but possibly the starting difficulty is due to the inlet valve becoming worn in its guide. If the machine has covered any considerable distance, it probably requires generally overhauling.

FIFTEEN GOLD MEDALS BETWEEN THEM.

Geo. Dance (3½ Sunbeam) and G. W. Walker, the Norton exponent, at the East Midland Centre A.C.U. Speed Trial held at Grimsthorpe. No wonder Dance smiles, for, with a favourable wind and a slight down grade, he accomplished a speed of 96 m.p.h.

SPEED AND GEAR RATIO.

Having just purchased a new machine, a 4 h.p. semi-T.T. Douglas, which I intend to ride entirely solo, I should be obliged if you could tell me: (1.) If it would stand a top gear of 4 to 1, and what would be its maximum speed at this gear or one you would recommend? (My weight is 11st.) (2.) Is the lock nut on the adjustable belt pulley a left or right-hand thread? (3.) How can I adjust the oil supply from the pump to the crank case, as the engine continually smokes?—D.H.S.

(1.) A 4 to 1 gear is rather too high. About 4½ or 4¾ to 1 would be better. Probably the speed would be greater on the lower ratio—about 50 to 55 m.p.h. (2.) Left-hand thread. (3.) There is no adjustment provided other than the drip feed which controls the supply to the front cylinder. If the engine is overlubricated and the oil consumption is very high, we would advise you to have an auxiliary tap fitted in the delivery pipe from the pump.

DRIVING A DYNAMO.

Where do you consider the best place to drive a dynamo on a B.S.A. sidecar outfit? The dynamo I am thinking of purchasing has an output of 6 volts at 1,800 r.p.m. I thought of enclosing it in a case and fixing to the back carrier, obtaining the drive from the brake rim of the back wheel by a spring band. The dynamo has a pulley of approximately 3in. (2.) Should I obtain the correct number of revolutions this way? (3.) By using a 6 volt dynamo and 6 volt lamps, should I find a 4 volt 80 amp. accumulator satisfactory? I realise the light would be dim without the dynamo running; but would the accumulator come to any harm?—T.A.F.C.

(1.) Driving a dynamo from the back wheel of a motor cycle is not at all a satisfactory method, as it is most difficult to maintain a constantly high speed. It would be much better to take the drive from a small sprocket or pulley fitted on to the engine-shaft. It would be best to drive the dynamo at engine speed. (2.) Probably the average speed of the engine is in the neighbourhood of 1,500 to 1,800 r.p.m., and it will be necessary that you purchase a dynamo having some form of cut-out device for speed regulation purposes. (3.) It will be necessary to use a 6 volt dynamo in conjunction with a 6 volt accumulator unless you use a resistance in the charging circuit.

SELECTIVE GEAR SLIPPING.

I have tightened up the friction band upon the outer quick thread drum of my Scott gear, thus leaving the gear pedal just free in neutral. The low gear now grips firmly and remains so engaged when the rear wheel is turned. The high speed, however, barely grips even when the operating pedal is well pressed down, and immediately releases itself when the pressure is removed. The friction band is as tight as I dare make it without risking twisting the screw off. Is it a case of internal damage, or is there any other means of making the high gear engage firmly without the necessity of completely dismantling the gear? What is the principle of the gear, and will you give me a brief and simple description of its working, and the probable cause of the trouble? Recently I went for a short spin (fifteen miles) and had not gone one mile before my radiator was boiling over, and I had to allow it to cool before I thought it advisable to continue. This occurred three times in fifteen miles, the engine gradually losing power. Is not this due to the gear slipping, as from my examination it must be doing for most of the time, even possibly when the pedal is pressed well down?—W.M.

There should be no need to tighten the friction band until there is danger of twisting off the screw, and evidently the two-speed gear is worn. The wear is usually confined to the expanding steel ring in the gear itself, and may be taken up by inserting new oversize rollers in the thrust lever. We should recommend you to obtain the "Book of the Scott" from the makers, as this gives very complete instructions as to the management of this machine. The overheating of which you complain may also be due to the ignition being too far retarded, or to lack of oil; if the engine is an old model, it probably requires overhauling and cleaning.

EXPERIENCES WANTED.

"J.H.W." (London).—Coventry-Victor flat twin. Engine speed, power, reliability, and coolness of running.

"W.W.R." (Waddington, N.B.).—A.B.C. Lubrication system and reliability.

"F.K." (Woodbridge).—1919 Powerplus Indian. General reliability, running costs, and possible defects.

READERS' REPLIES.

GEAR ADJUSTMENT.

Re your reply to "H.R." on gear slip in *The Motor Cycle* of March 24th, I give my experience, which I think will apply to him also. I contend that "H.R.'s" gear lever is fitted on to the operating spindle with a key and nut, and that the key is slackly fitted or badly worn. When "H.R." changes gear, he has to lift clutch and slam in. The constant slamming when dogs or teeth are *not* in mesh is reflected on the quadrant key. To test, operate the gear lever whilst engine is standing. It will probably be found that if the lever is forced a little, when the middle gear teeth are *not* meshed, a small amount of give will be found both ways, either from low to middle, or middle to low or high. For final setting, take off the inspection cover, see that the second gear wheels are truly in mesh, see that gear lever on quadrant is properly fast, then nip up the gear lever nut with a powerful spanner until the threads threaten to strip.—L. BITHELL.

COMPARING ACETYLENE AND ELECTRIC LIGHTING.

There was a recent query in *The Motor Cycle* with regard to the relative merits of electric and acetylene lights in an acetylene lamp. I have a 5½in. P. and H. head light which I converted to electric, which for street work and just after lighting-up was quite satisfactory, but for country work in the dark was not to be compared with a fourteen-litre acetylene burner. The electric bulb gives a very narrow pencil of light and a somewhat dim, broad beam; whereas the acetylene burner gives a further bright beam and a bright broad beam for near work. My accumulator was a four-volt Fors, which is very excellent. It apparently holds its charge indefinitely when standing, so that there is no need to have it recharged if it is not being used.—SOUTHCOMB MAY.

Important Dates.

Sat., April 16th—Yorkshire Centre A.C.U. Open Hill-climb at Sutton Bank.
Sat., April 23rd—Midland Centre A.C.U. Open Reliability Trial.
Wed., April 27th—A.C.U. One-day Trial
Fri., April 29th, and Sat., April 30th—Ealing and District M.C.C. London-Holyhead Open Reliability Trial.
Sat., April 30th—Newcastle and District M.C. Travers Challenge Trophy Open Reliability Trial
Sat., April 30th—Surbiton and District M.C.C. Open Inter-Team Trial (Private Owners only).
Sat. May 7th—B.M.C.R.C. Open Meeting at Brooklands.
Fri., May 13th, and Sat., May 14th—M.C.C. London-Edinburgh Run.
Sat., May 21st—Western Centre A.C.U. Open Hill Climb.
Wed., May 25th—A.C.U. Silencer Trial at Brooklands.
Sat., May 28th—East Midland Centre A.C.U. Open Hill Climb.
Tues., June 14th—Junior T.T. Race
Thurs. June 16th—Senior T.T. Race.
Sat., June 25th—M.C.C. Inter-team Trial for "The Motor Cycle" Cup
Sat., July 2nd—Bournemouth M.C.C. Open Reliability Trial.
Sat., July 2nd—North-Western Centre A.C.U. Open Speed Trials.
Wed., July 6th, and Thurs., July 7th—Arbuthnot Trophy Trial.
Sat., July 9th—St. Andrews Speed Trials
Mon., July 11th, to Sat., July 16th—Scottish Six Days' Trial.
Sat., July 23rd—East Midland Centre A.C.U. Open Speed Trials.
Sun., July 24th—Motor Cycle Grand Prix Race in France.
Mon., Aug. 1st, to Sat., Aug. 6th—International Six Days Trial in Switzerland.
Mon., Aug. 29th, to Sat., Sept 3rd—A.C.U. Six Days Trial.
Sat., Sept. 17th—Grand Prix Race for Cycle Cars.

SPARKLETS

A Colmore Cup Amendment.

A silver medal has now been awarded to C. R. Little, who rode a Coventry-Victor-engined El-ve sidecar outfit in the Colmore Cup Trial; he was formerly credited with a bronze.

Norton Success in South Africa.

Fastest time of the day in the last hill-climb of the Pretoria M.C.C. was made by Percy Flook, probably the best known speed rider in South Africa. He was mounted on a 3½ h.p. Norton.

C.T.C. Handbook.

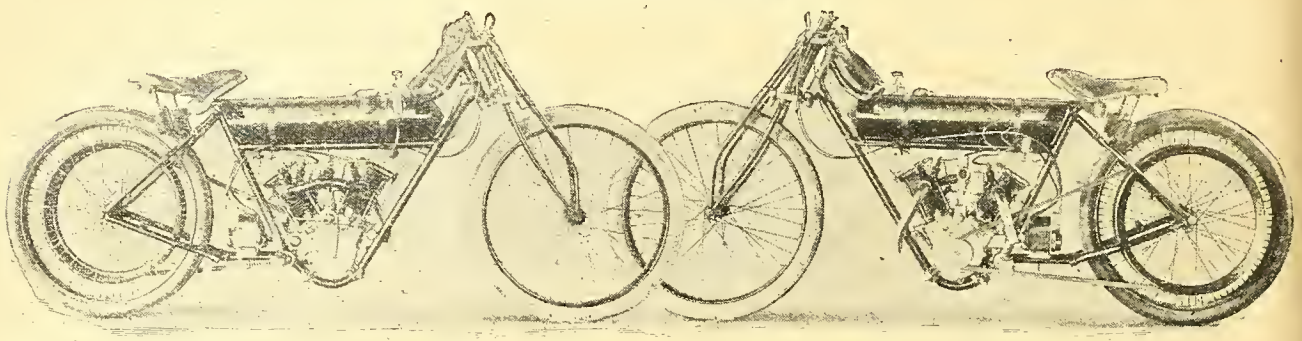
Although primarily devoted to cycling interests, much useful road information is contained in the latest edition of the Cyclists' Touring Club Handbook and Guide; recommendation of moderate priced apartment accommodation is its special feature.

A Guide to the Lowlands.

A country rich in historical and picturesque interest encircles the town of Dumfries, from which place we have received a copy of Dinwiddie's "Guide to Dumfries" (R. Dinwiddie, High Street, Dumfries; price 1s.). Although not unduly inspired, and somewhat marred by a liberal use of capitals in the text, it contains much sound information relating to Dumfriesshire and Galloway. Maps of the district, tours, and itineraries are also included.

Catalogues Received.

Cooper Sidecars, Belgrave Road, Birmingham: A well-written booklet, which, apart from its primary purpose of describing the various Cooper models, contains some very readable notes on the history of sidecars and hints on their use.



The Hobart Cycle Co., Ltd., Coventry: Full details of the latest Hobart models—the 2¾ h.p. four-stroke, the 2¾ h.p. two-stroke, the 2¾ h.p. spring frame lightweight two-stroke, and the lightweight single-speed model, which is now priced at £56 10s.

New Imperial Cycles, Ltd., Imperial Works, Princip Street, Birmingham: Catalogues of the 8 h.p. and 2¾ h.p. New Imperial motor cycles and the 8 h.p. New Imperial booklet; also a booklet entitled "Merits of a Motor Cycle," giving a brief history of the New Imperial, together with some interesting facts, such as running costs, which are not usually given in makers' publications. The cost of running a New Imperial Model 2 is given as 1½d. a mile, as compared with the 2½d., which, it is stated, the standard 4 h.p. single type of machine requires per mile. These costs include taxes, insurance, and upkeep for three years and cost of depreciation for three years. Some interesting photographs are reproduced from *The Motor Cycle*.

C3

THE FIRST OF THE T.T. RACERS.

Range of Racing Martins include Machines for Junior and Senior T.T. and a Big Twin for Record-breaking.

The tiny racer to be used by Harry Martin in the Junior T.T. It is shown with single gear and belt drive, but an Enfield gear will be fitted for the race.

BEFORE the war Martin motor cycles were famous for their speed. They held several records, and put up consistently good performances at Brooklands race meetings. This year will see the reintroduction of speed machines bearing the well-known name, and the approaching Tourist Trophy Races are responsible for much activity in the experimental department at the Martin works.

While the T.T. Martin motor cycles are not absolutely complete, they are in an advanced state of construction, as we found on the occasion of our visit last week to the works of Messrs. A. G. Miller, Ltd., at Scrubbs Lane, Willesden, London, N.W.10.

Machines for the Senior Race.

The Martins entered for the Senior Race will be fitted with M.A.G. overhead valve engines having a bore and stroke of 64 mm. and 77 mm. respectively. These engines are splendidly finished and well thought out, even to the fitting of grease cups to the valve rockers. Mushroom valve type priming cocks are provided in the walls of the cylinders, and not in the heads, as is usually the case; but these are not found to be necessary, as the engines are easy starters. The machines are practically identical (except as regards certain alterations in the timing) with those used by Collier in the 1914 T.T. Though Enfield gears will be used in the Isle of Man, the machine we saw was fitted with the three-speed Matchless gear box, giving ratios of 4.7 to 1, 6.5 to 1, and 8 to 1. The transmission shock absorber fitted to the engine-shaft is a miniature model disc clutch, twelve small springs abutting against the plates; and the degree of slip may be adjusted to a nicety. It is expected that the single-lever Claudel-Hobson carburetter, which has given such excellent results on the track, will be used.

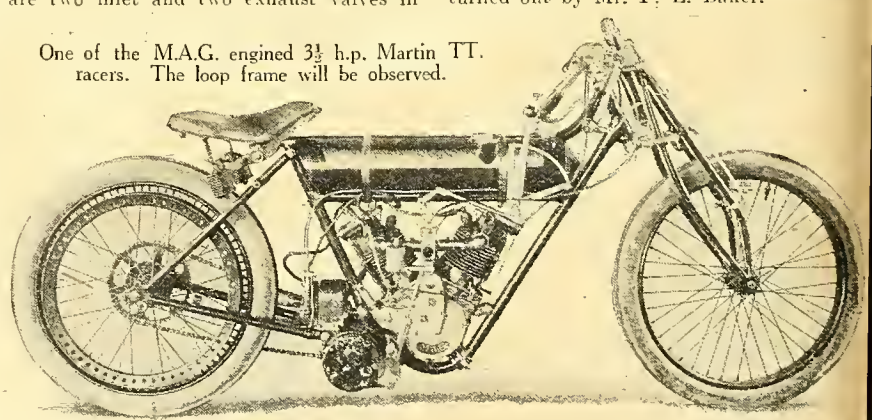
The riders in the Senior Race will be Harry Martin, O. M. Baldwin, and Capt. A. G. Miller.

For the 250 c.c. Class.

Two types will be entered in the Junior event. The first is a very interesting little mount with an engine reduced from the 350 c.c. type to 250 c.c. by cutting a portion off the top of the cylinders and fitting long holding-down bolts for the purpose of securing the head. The revised size is 54×53.5 mm. (250 c.c.). A new crank pin has been fitted, the flywheel has been altered, and the engine rebalanced. The other machine in the Junior Race will be practically identical, except that it will have the 350 c.c. standard 53×75 mm. M.A.G. engine.

The riders in the Junior Race will be Harry Martin, who will ride the 350 c.c. model, and T. Eve, who will have the smaller engine.

A Class E Racer.



By far the most interesting machine we saw on the premises was the 992 c.c. racer, which Capt. J. Woodhouse was in the process of tuning up for record breaking. It was seen on the track last year on only two occasions; but this year great things are expected of it, and an early attack will be made on the 1,000 c.c. short distance records. It is said to have been unofficially clocked to do 102 m.p.h., and it is anticipated that its speed will be over 100 m.p.h. against the time-keeper's watch.

Like all the Martin racers, the frame is low built, and the engine, which has a bore of 82 mm. and a stroke of 94 mm., is said to have given 37 h.p. on the brake at the M.A.G. works in Geneva. There are two inlet and two exhaust valves in the head of each cylinder, and the valve ports have been carefully studied.

Great care and thought have been exercised in its design, and as an example of this we may mention that there are radiating fins round the bearing supports of the large valve rockers. There are two rockers on each of the two spindles, and these are worked by long tappet rods off the timing gear. To ensure steadiness of steering at high speeds, Woodhouse is fitting a plate clutch arrangement at the bottom of the steering head, controlled by a screw at the top of the handle-bar stem, so that the steering can be tightened while the machine is actually running, and when it has attained a certain speed. The racer has a single gear and an adjustable pulley, the normal ratio being 2¼ to 1. Naturally, some difficulty is experienced in finding a belt that will stand up to this engine.

The Man who will Ride it.

Capt. Woodhouse, who distinguished himself by doing remarkably difficult and hazardous work of a highly confidential nature as a pilot during the war, is now attached to the British Embassy at Vienna, and is amusing himself with the big record breaker during his leave. He has been a motor cyclist for fifteen years, and first began racing on the saucer track at the Aston Villa grounds in Birmingham on the early type Precision machines turned out by Mr. F. E. Baker.

One of the M.A.G. engined 3½ h.p. Martin TT. racers. The loop frame will be observed.

CURRENT HAT

Times to Light Lamps.

April 14th	...	...	8.21 p.m.
,, 16th	...	...	8.25 ,,
,, 18th	...	...	8.28 ,,
,, 20th	...	...	8.31 ,,

T.T. Races in Australia.

As part of the centenary celebrations at Goulburn, New South Wales, motor cyclists in that district held Junior and Senior T.T. races. The successful riders were L. Apps and G. Nichols, both on ¾ h.p. Douglas motor cycles. The course was one hundred miles.

Licences of Stolen Machines.

Motor Transport learns that the Ministry of Transport has issued an announcement to the registration authorities to the effect that it will be prepared to consider applications for the issue of new licences without extra charge in a case in which a new vehicle of a similar type is to be purchased to replace a stolen one.

Police Traps in Cambridge.

Police traps are not common in country districts nowadays, but apparently there is one working between Ely and Littleport Police Stations. Our informant says: "Timing is incorrect, and a Ford recently was stated to have covered the 4½-5 miles stretch in five minutes.

There is also said to be a police trap approaching Whittlesford level crossing, on the Royston-Newmarket Road, which has been placed there after a serious accident had taken place at the cross roads on the Royston side of the railway.

It will be noted that both these police traps are in the county of Cambridge.

Lights on Stationary Vehicles.

The Autocar mentions this week the case of a motor cyclist who left his machine standing against the kerb at night with both head and rear lamps alight, the head light facing towards what would have been the wrong side of the road had the cycle been in motion. Whilst in this position it was run into and damaged by the driver of a car. In an action for damages against the owner of the car, the defence was that the car driver, seeing the head light, mistook it for a moving light coming towards him, and, consequently, kept to his left, so colliding with the cycle. The Judge, in finding for the car owner, considered the action of the cyclist in leaving his cycle standing in the road with its front light in such a position was misleading. The cyclist should have turned the bicycle round so that the red light would have shown.

A Simple Question.

How many of the motor cyclists who carry a spare can of petrol on their machines are aware of the additional load they are transporting about the country? How many, indeed, could answer off-hand the simple question, "What is the total weight of a two-gallon tin of petrol?" The answer is 18 lb.

Motor Cycle Trials Overseas.

A petrol consumption trial was recently held by the Ashburton (New Zealand) and District Club, over a course of sixty-four miles in which the roads were very rough, and where there were a number of water courses which had to be negotiated. The results were as follows: New Imperial sidecar, 88⅛ m.p.g.; Harley-Davidson sidecar, 77⅞ m.p.g.; Indian sidecar, 76⅛ m.p.g.

T.T. Races at Brooklands Track.

Among other contests provisionally arranged for the meeting at Brooklands track on Saturday, May 28th, are a twenty-four lap race for Junior T.T. machines, and a twenty-eight lap race for Senior T.T. machines. All motor cycles coming within the definition of the Junior and Senior T.T. contests respectively will be eligible for entry for these contests, and it is anticipated that some of the actual machines which will race in the Isle of Man the following month will take part.

Weights.

Obvious to all who know the approximate weights of motor cycles, the 230 lb. debited to the Diamond in our road test description in last week's issue was a typographical error. Its correct weight is 168 lb., and it is, therefore, subject to only 30s. tax.

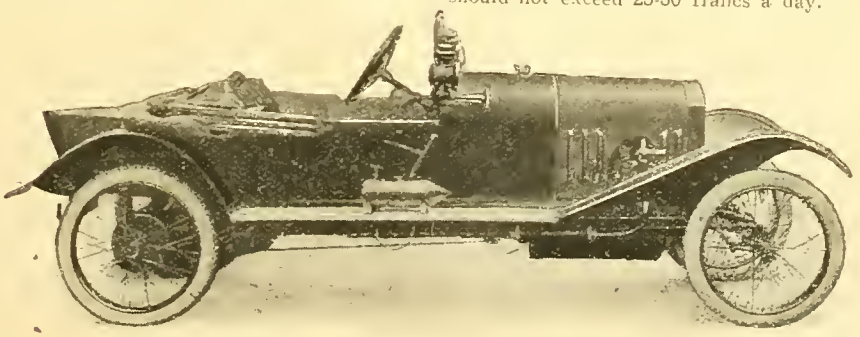
Special Features.

A FIVE CYLINDER ROTARY ENGINE.
DAY TRIPS AND WEEK-ENDS.
THROUGH FEMININE GOGGLES.

For H.M. Surveyors.

H.M. Office of Works is employing a motor cycle for use by surveyors in connection with the South Wales housing scheme. A Quadrant sidecar is the machine selected.

Victory Cup Amendments.



The Committee of the Birmingham M.C.C. have made the following corrections in their list of awards for the Victory Cup Trial:

J. Lee (7·9 Indian), G. Denley (2¼ Velocette s.c.), and A. Frazer Nash (G.N.), gold instead of silver medals; A. W. G. Martin 4 Triumph), gold medal (omitted); E. C. Iles (3½ Sunbeam), silver medal (omitted).

The following are still in abeyance: B. Bourke (2¼ New Hudson), B. H. Norris (2½ Sun), J. Allen (3 Neal-Dalm), A. J. Wilkes (3½ Rover), R. B. Clark (2¾ Coulson B), H. Poole (4¼ B.S.A.), and A. E. Wood (6 B.S.A. sc.).

Paris-Pyrenees-Paris Trial.

We have received further details concerning the Paris-Pyrenees-Paris Trial, which has now been officially sanctioned by the U.M.F. One of the most interesting portions of the trial will be the section from Pau to Toulouse by the passes of the Pyrenees. This will be the first trial held in this interesting district, and will entail much hill-climbing and gorgeous scenery. The return journey from Toulouse to Bordeaux will be by Castelsarrasin and the beautiful valley of the Garonne. The competitors' machines will be on exhibition on Ascension Day at Bordeaux, and the next day the return journey will be made to Paris. The trial starts on April 30th. We understand that competitors' living expenses should not exceed 25-30 francs a day.

A competitor to the higher-priced sidecar outfits—the popular model of the G.N., which costs £198. This addition to the G.N. range has practically the same specification as the more expensive machines, but is shorn of such embellishments as interchangeable wheels, spare wheel, dynamo lighting, etc.

Prices Reduced.

Ivy motor cycles have been reduced in price between £7 and £12 according to model. P. and M.'s are down £10 all round. Rex adjustments are: 4 h.p. model, £120; 8 h.p. chain-belt outfit, complete with spare wheel, etc., £200; chain drive, £205. The chain-belt 8 h.p. Acme is now £185.

Absent-minded Beggars.

Those of our readers who fail to obtain a reply to letters sent to advertisers should write again. Every week we hear from manufacturers who have received orders—sometimes with money enclosed—from which names and addresses have been omitted.

Will 500 c.c. Motor Cycles touch 100 m.p.h. This Year?

What is the maximum possible speed of a 500 c.c. machine? We are now approaching the 100 m.p.h. mark. Up to the present R. N. Judd (3½ Norton) has made the highest speed with this size of engine, *i.e.*, 92.44 m.p.h. for the flying kilom. Considering the importance of carburation in attaining such speeds, it is worthy of note that Judd used a Binks carburetter.

Speeds at Grimsthorpe Park.

The very high speeds accredited to competitors at the recent speed trials at Grimsthorpe Park require a little explanation. It will be recalled that G. Dance (3½ Sunbeam) covered the half-mile at a speed of approximately 96 m.p.h., and that even a tiny Velocette driven by a lady accomplished over 69 m.p.h. We admit that we were loth to be convinced that the times and distances were correct, and, in the interests of authenticity, we approached Mr. T. F. Bidlake, the official timekeeper, and the surveyor who laid out the course. Both assure us that the figures were correct, but add notes which go to explain the high speeds. The course was slightly on the down grade, and there was a strong following wind. It is not inferred that these favourable conditions in any way detract from the merit of the respective performances.

The Transport Crisis.

Motor cyclists are urgently requested to assist in the event of a national transport emergency. A large number of private motor cyclists will be required for the Government for various essential national services in the event of a suspension of ordinary forms of transport. The Auto Cycle Union and the Automobile Association have been requested to assist in the provision and organisation of these motor cyclists. All motor cyclists who are able to assist are urgently requested to register their names with the A.C.U. or the A.A. immediately. The requirements of the Government, the extent of which will naturally depend upon developments, are as follows:

1. Private motor cycles (with or without sidecars) owned and ridden by owners who are willing to volunteer for *(a)* whole time service; *(b)* part time service. Free petrol and oil will be allowed, and, if demanded, an allowance of £1 per week per motor cycle; 7s. 6d. per night subsistence (to cover a period of twenty-four hours) may be granted where owners are required to sleep away from their homes. The £1 per week will cover all the responsibility of the Government, except such risks as are not covered by an ordinary policy of insurance.
2. Riders without motor cycles for whole time service. The pay for motor cyclists, whether riding their own machines or not, will be £3 15s. per week; no guarantee as to hours; no overtime; with the addition of a subsistence allowance of 7s. 6d. per night (to cover a period of twenty-four hours) where motor cyclists are required to sleep away from their homes.

'Ware Long Exhaust Pipes.

It is reported that a "noise trap" is in operation close to the Eagle Hotel, Snaresbrook.

Zip! Bang!! Boom!!!

This is how an American trade contemporary heads an announcement of a sales campaign:

"ZIP! BANG!! BOOM!!!—We're off in a Bunch. The biggest thing that ever happened in motor cycle activity. Trade leaders make plan for smashing booster campaign that will bring every Red Blooded Rider and Live Wire Dealer up on His Toes."

This, and much more like it, reveals the attitude of the American trade when it starts to get a move on!

Speed Trials in Natal.

In the Natal M.C.C. speed trials held on the Isipingo Road, the fastest time was made by R. Suzor, on a Norton, in the 500 c.c. class. The same club also recently held a hill climb, with the following results:

SOLO CLASS.—1, A. E. Kirkwood (3½ Premier); 2, F. A. Zurcher (3½ Douglas); 3, T. Kenyon (4 Triumph).

SIDECAR CLASS.—1, A. W. Ricks (7-9 Harley-Davidson sc.); 2, H. P. Harper (7-9 Indian sc.); 3, C. Foster (6 M.S. sc.).

The A.C.U One Day Trial.

A very satisfactory entry has been received by the A.C.U. for the One Day Spring Trial due to take place on Wednesday, the 27th inst. Many of the manufacturers are entering "stock" machines, and among the trade entrants at the time of going to press may be mentioned the Raleigh Cycle Co. (for the first time), A. J. Stevens and Co., Triumph Cycle Co., Sun Cycle and Fittings Co., Phelon and Moore, Morgan Motor Co., Humber, Ltd., Trump-Jap, and British Radial Co.

Imports and Exports.

There has been a slight increase in both imports and exports of motor cycles for March as compared with February. This is perhaps more noticeable in the import figures, where, although only two more complete motor cycles are tabulated for last month, the total value of machines and parts shows an approximately 90% increase of £9,405. On the other hand, 154 more machines were exported, the total increase in value being £11,540. Comparative tables, extracted from the Board of Trade Returns for February and March, are appended:

IMPORTS.

	February, 1921.	March, 1921.
Number of motor cycles	23	25
Value of machines and parts	£10,484	£19,889

BRITISH EXPORTS.

	February, 1921.	March, 1921.
Number of motor cycles	663	817
Value of motor cycles only	£55,004	£68,618
Value of parts	£31,066	£28,992
Total value	£86.070	£97,610

SOUTH-EASTERN CENTRE A.C.U. INAUGURATION.

A scene during the slow race at the picnic held at Blindley Heath last Saturday. A big crowd gathered for the celebration, which was an unqualified success. The following clubs were represented—Woolwich, Brookdale, Wallington, Redhill, Surbiton, Brighton, Lewes, Public Schools, Eastbourne, Ealing, B.M.C.R.C.

TWO DAYS WELSH MOUNTAINEERING.

Western Centre A.C.U. Trial a Great Success. 20 m.p.h. over Mountain Roads eliminates Half the Starters.

Up to their wheel spindles—the deepest of the many watersplashes competitors had to navigate. J. W. Bevers (3½ Wilkin) and A. R. Passey (3½ Norton) at the foot of Sarn Helen.

The First Day.

PROBABLY the inhabitants of the mountain regions of Central Wales felt that they were having the time of their lives last Friday morning, for no sooner had the eclipse ceased its display than the advance guard of some hundred riders disturbed the quiet of the spring morning.

Although the Western Centre Two-day Trial, which was dated for April 8th and 9th, did not receive trade support, it attracted a very representative entry, and nineteen club teams were nominated.

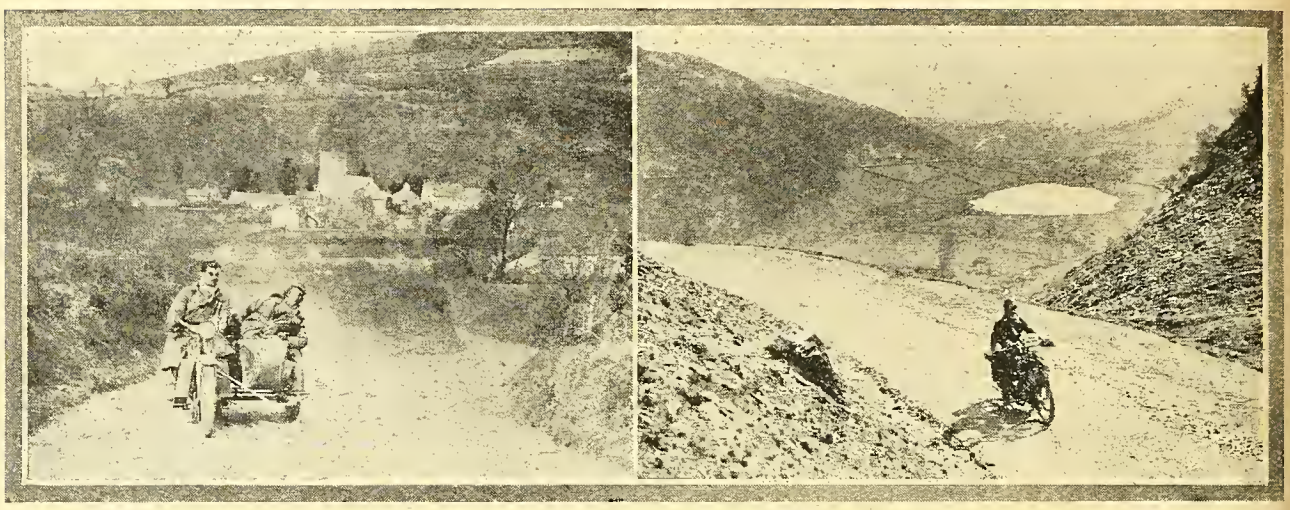
Hereford, the starting point, was filled with motor cyclists on the Thursday evening previous to the start, and there was a busy scene up to a late hour in last minute preparations and adjustments. The weather of the preceding days had been ideal and promised well for the trial; its promise was borne out, and ideal conditions prevailed until the end of the second day.

Curious Eclipse Effects.

Solo riders were first sent away (in pairs) at one minute intervals, the first two leaving at 8.30 a.m. After threading a way through the battery of photographers and cinema men the splendid main road to Hay was followed as far as Glasbury, at which point a detour was made to the first check at Bronllys. During this early section of the day's run the partial eclipse of the sun accounted for the excessive cold of the morning, and some curious effects of shadows cast on the roadway were noticed by observant riders. The next two checks were easy, and it was not until the Elan Valley road from Rhayader was taken that the competitors realised they were in for something serious.

Favourable Weather Conditions.

Had the weather been wet, it is extremely likely that only a small proportion of the starters would have survived the morning's run; but under the bright sunshine the loose and shale-like ascent of the Elan Valley road was quite easy. Descending again on a road which skirts the precipitous hillside, the first of three watersplashes was reached. This and the next were easy, but the third, which was observed, unseated most of the solo riders. No matter how slowly the approach was made, the front wheels dropped suddenly through a foot of water on to a floor of loose, round, and slimy boulders—a combination too much for most of the entry.



It did not seem to matter what type of machine was used, failure appeared to be inevitable, until E. Griffiths came along, and, with feet in air, demonstrated the possibility of steering a straight course on his 3½ h.p. Norton.

J. A. Carvill, a sporting Triumph rider from Dublin, also made a good show, as did J. Lee (7-9 Indian). Most of the other solo riders performed indifferently at this point, despite care and low gears. After this, the road on to Devil's Bridge was rough and rutted, and of the give-and-take variety—mostly "take"! Along this stretch a remarkable effort was made by B. L. Bird (4½ B.S.A.) to make up his time, which had been lost in effecting gear control adjustments and drying his magneto, which appeared to suffer in the watersplash. Owing, however, to the short distances between checks, it was extremely difficult to make up any time once it was lost; moreover, time lost in one check could not be regained in another.

A bad hairpin on a falling grade was the next difficulty undertaken, and quite a number failed to get round. Very good showing at this point was made by E. Clarke, jun. (4 Douglas sc.), and H. F. S Morgan, who wrenched his special short-wheelbase Morgan round in a wonderful way. A further long and loose-surfaced hill accounted for no failures, and a gentle run then brought the great majority of the starters into the lunch check at the Hafod Arms Hotel, Devil's Bridge.

A Rough Passage.

Twenty-seven miles of main road now followed to Machynlleth, a section devoid of incident for all except R. Fellows (3½ Sunbeam), who suffered three punctures. From the last-mentioned place the Plynlimon Road, through Stay-a-Little, to Llanidloes was taken, and this proved one of the most difficult stretches of the whole trial to negotiate at the schedule speed of 20 m.p.h. The loose and shaly ascent of the mountain was followed by grass tracks interspersed with jagged outcrops of bedrock, over which frames, wheels, and riders' nerves were tried to the utmost.

(Left) G. Packman (8 Matchless sc.) on Caio Hill. (Right) E. W. Spencer (4 Omega) on the hill out of Rhayader.

The descent to Stay-a-Little was particularly bad, and the machines bumped and bounced alarmingly as occasional patches of smooth grass, tempting speed bursts, suddenly ended in a chaos of loose stones.

W. I. Thomas (3¾ Scott) and W. G. Church (2¼ Velocette) appeared to know this section well, the latter taking some of the rocks at a great pace, and not bouncing worse in consequence than many who went more slowly. Both these riders, however, were subsequently in difficulties, for Thomas ran out of petrol at Stay-a-Little, and also had a broken throttle wire, while Church retired on the second day. R. Fellows took a bad toss, and retired on this section; while S. T. Tessier (8 Bat sc.) got a stone in his driving chain while descending a rough hill, and lost much time in consequence. Over the rocks G. Packman's 8 h.p. Matchless outfit was noticeable for the easy riding it appeared to give.

From Llanidloes the main Aberystwyth road was taken with a slight *détour* at Dyffryn Castell to cross a ford over a tributary of the River Rheidol; although wide, this was comparatively easy, and consequently caused little trouble; G. W. Wilkin (4 Wilkin sc.) retired at this point with engine trouble.

Arrival at Aberystwyth ended the day's run, and the survivors were at liberty to enjoy either their dinner or the sight of the setting sun beyond a blue sea and a cloudless sky.

Second Day.

Again perfect atmospheric conditions prevailed on Saturday, and the 8.30 a.m. start was made with every prospect of another summerlike day.

From Aberystwyth to Llanrystyd is a first class main road, and absence of traffic permitted everyone to get well ahead of time. A. T. Colcombe (4 Indian) and G. J. Baragwanath (3½ Sunbeam) both set a very hot pace, and the former, as No. 1, maintained his position throughout. After leaving Llanrhystyd a hill of some severity with a splendid surface was encountered, and after a rather stony section a good main road was again reached at Trefilan and followed to Llangybi, the first check.

A cross country road was then taken *via* Llanfair Clydogau over Saru Helen, through two watersplashes and back to the main road again at Pumpsaint, leaving it again in two miles, for Caio. Immediately before this village was reached a deeply rutted lane was traversed which would have been most difficult had it not been dry.

A Stony Ladder.

Caio Hill is moderately severe in gradient, its chief difficulty being the fact that it has a surface of bare rocky ledges. One or two of the riders, notably Colcombe and Baragwanath (mentioned above), and L. L. Sealey and H. Poole, on their 4¼ h.p. B.S.A.'s, took the rough surface at a tremendous pace, as did H. Gibson (8 Ruby sc.). Between the top of Caio and the next check at Cynghordy several riders failed to negotiate a severe corner, one crashing through the hedge, and in endeavouring to avoid his machine Hugh Gibson completely overturned his own outfit; this caused his retirement, as the sidecar passenger was injured and unable to proceed.

A deep watersplash on this section resulted in many spills, but L. Paynter (3½ Norton) was successful, while A. Lindsay (3½ Norton) and M. Hartland (2¼ Velocette) both got through, but fell in the shingle on the farther side. E.

Eric Williams (7 A.J.S. sc.) on one of the worst hairpin bends of the trial—Pont-rhyd-y-Groes.

Outside the time check at Rhayader. Each check counted separately, after the system of the Scottish Trials.

Inside a water check on Sarn Helen. F. Davies (3 A.B.C.) and J. E. J. Whitaker (4½ B.S.A.) put their best leg forward.

TWO KINDS OF "CHECKS."

Kickham (3½ Douglas) fell in the middle of the stream, and, on rescuing his machine, found that the engine would only revolve backwards, owing to some internal disorder, so had to retire. Another watersplash just outside the check caused more trouble, and at this the outstanding navigator was E. Williams (7 A.J.S. sc.).

In the next control a grass-grown mountain road from Llanfair-ar-y-bryn to Llangammarch Wells was easy; then followed main roads to Builth, and the lunch stop at Llandrindod Wells.

A Mountain Snowfall.

During the interval, heavy snowfalls occurred on the mountain tops, while rain fell at lower altitudes, making the roads greasy in places.

The first portion of the final afternoon's run was by main road through Builth and along the Brecon road to Upper Chapel, where a tortuous *détour* down the Afon Yscir valley was made, terminating at the check in Brecon. From this place the southern slopes of the valley of the Usk were traversed as far as Llangynidr—surely one of the prettiest places in the British Isles (and with a name as delectable to pronounce!) From this village an exceedingly steep pitch led the competitors, as the route card ingenuously stated, "over mountain to Beaufort"; the climb was easy, however, and the scenery truly majestic. After the Gilwern check a perfectly good section, including some splendid main roads, brought the rapidly diminishing survivors through Talgarth to Hay, where the final time check was taken preparatory to embarking upon the last, most talked of, and most dreaded climb of the whole trial.

'Ware water! H. M. Goddard (4 Triumph), followed by B. Bladder (8 New Imperial sc.). at the watersplash between Rhayader and the Devil's Bridge.

The Coup de Grace.

Truly the organisers reserved the worst trouble for the last section within twenty miles of home, and as a downpour had also commenced, the severe hairpin climb of Tre Fadoc, on the northern foothills of the Black Mountains, "caught out" several who had not previously lost a mark; amongst these unfortunates must be named A. Lindsay (3½ Norton), S. M. Greening (3½ Sunbeam-Jap), H. M. Goddard (4 Triumph), and D. G. Prentice (8 Morgan).

An easy run of twenty miles brought the arduous two days run to an end, and many echoed the words of one weary rider as he checked home, "Thank Heaven that's over!".

The organisation of the trial throughout was splendidly carried through.

At the foot of Caio Hill. A. E. Taylor (6 B.S.A. sc.) leaving the village. This hill gave no trouble to competitors.

Most of the riders were emphatic in declaring that better route marking and management could not be imagined. For the placing of direction arrows special praise must be given to the local representatives of the Anglo-American Oil Co., who loaned their cars and assistance, while during the run their petrol was available at even the most unlikely and out-of-the-way controls.

Enthusiastic officials also worked with a will, and, despite their two days on the road, sat up all Saturday night, announcing the results at 4.30 next morning.

INCIDENTALLY—

S. A. Such (2½ Connaught) and G. W. Shepherd (2¾ Beaumont) deserve special praise for qualifying for awards with their small machines.

Undoubtedly the pluckiest ride of the whole trial was that of H. J. Willis (3½ Norton), who broke off the left half of his handle-bar early in the first day's run; he steered through the remainder of the course with one hand, fixing the clutch lever to the handle-bar stem. On the second day a stout ash stick replaced the missing portion of the handle-bar.

From the point of view of gradient the hills were not really severe. No one lost a mark on hills during the first day, but Tre Fadoc caused trouble near the end of the second afternoon.

Competition riding in Ireland being rather a thankless occupation at the moment, J. A. Carvill came over from Dublin, competed as a Worcester M.C.C. club team member, and made a better performance than his two team mates, who were local men.

Details of four-wheeler results will appear in Saturday's *Autocar*.

PROVISIONAL RESULTS.

91 MOTOR CYCLE AND THREE-WHEELER ENTRANTS.
84 STARTERS. 43 FINISHERS.

23 Gold Medals.	1 No Award.
10 Silver Medals.	37 Retired.
9 Bronze Medals.	4 Disqualified.

THE WHITE CHALLENGE CUP (for most outstanding performance).—A. T. Colcombe (4 Indian).

SUNBEAM GOLD MEDAL (for outstanding performances on hills.—W. Brandish, jun. (4½ Humber).

AMATEUR PRIZES.—1, G. S. Boston (11 Morris-Cowley); 2, L. R. J. Blick (7 Harley-D. sc.).

BEST PERFORMANCE OF A WORCESTER M.C.C. MEMBER.—J. A. Carvill (4 Triumph).

CLUB TEAM PRIZE.

1. COVENTRY AND WARWICKSHIRE M.C.
   G. L. White (5 Rover).
   D. Atkin (5 Rover).
   W. Brandish, jun. (4½ Humber).
2. WORCESTER AND DISTRICT M.C.C.
   B. Bladder (8 New Imperial sc.).
   E. Williams (7 A.J.S. sc.).
   J. A. Carvill (4 Triumph).

GOLD MEDALS.—A. T. Colcombe (4 Indian), L. L. Sealey (4¼ B.S.A.), H. Poole (4¼ B.S.A.), T. B. Williams (4 Trinmph), J. Lee (7 Indian), J. A. Carvill (4 Trinmph), L. Paynter (3½ Norton), H. J. Willis (3½ Norton), L. Crisp (4½ Humber), W. Brandish, jun. (4½ Humber), D. A. Atkin (4½ Humber), G. L. White (5 Rover), E. W. Spencer (4 Omega) T. H. Richards (4 Triumph), E. R. Main (8 Zenith), T. B. G. Vale (3½ Beardmore), H. R. Harveyson (4 Indian), P. W. White (8 Sunbeam sc.), L. R. J. Blick (7 Harley-Davidson sc.), B. Bladder (8 New Imperial sc.), W. R. Brown (3½ Snnbeam sc.), E. Williams (7 A.J.S. sc.), and W. A. Carr (8 Morgan).

SILVER MEDALS.—A. Lindsay (3½ Norton), F. H. Wallis (3½ Rover), J. E. J. Whitaker (4¼ B.S.A.), S. M. Greening (3½ Sunbeam-Jap), H. M. Goddard (4 Triumph), W. Swiffen (3½ Norton sc.), W. P. Brandon (4 Triumph sc.), A. E. Taylor (6 B.S.A. sc.), G. H. Tucker (4 Norton sc.), and D. G. Prentice (8 Morgan).

BRONZE MEDALS.—J. Knowles (4 Triumph), E. Hughes (4 Triumph), G. W. T. Hartwell (3½ Norton), C. Dickens (3½ Dene), S. A. Such (2½ Connaught), G. W. Shepherd (2¾ Beaumont), F. Davies (3 R.B.C.), S. W. Lewis (4 Hoskison), and W. B. Gibb (3½ Douglas).

NO AWARD.—E. Colmer (2¼ Levis).

RETIRED.—H. Stringer (3¾ Scott), G. J. Baragwanath (3½ Sunbeam), J. C. Walker (2¾ Edmnnd), B. L. Bird (4¼ B.S.A.), H. F. Brockbank (8 Blackburne), F. S. Barnes (3½ Sunbeam), E. Griffiths (3½ Norton), A. L. Homer (4¼ James), R. Fellows (3½ Sunbeam), A. R. Naylor (3½ Snnbeam), F. A. Dickins (7 Harley), J. W. Bevers (3½ Wilkin), N. W. Smith (4 Trinmph), A. R. Passey (3½ Norton), E. Kickham (3½ Douglas), M. Hartland (2¼ Velocette), W. Howarth (8 Dot), W. G. Church (2¼ Velocette), W. I. Thomas (3¾ Scott), A. White (3 Neal-Dalm), J. Allen (3 Neal-Dalm), A. A. Prestwich (2¾ New Imperial), C. F. Townley (3½ Norton), J. H. Watson (3 Beardmore), O. G. Lewis (3½ Norton), Miss I. V. Corrie (2½ Connaught), C. Ellison (8 Zenith), H. Gibson (8 Royal Ruby sc.), E. G. Fery (8 Snnbeam sc.), S. T. Tessier (8 Bat sc.), H. J. Stretton Ward (8 Excelsior sc.), C. C. Beavis (7 Indian sc.), T. Silver (4½ Quadrant sc.), G. Packman (8 Matchless sc.), G. W. Wilkin (4 Wilkin sc.), R. I. Davies (6 A.J.S. sc.), and H. F. S. Morgan (8 Morgan).

DISQUALIFIED.—A. Thacker (2¾ Hoskison), W. Lord (3½ Sunbeam), J. R. C. Guest (4 Hoskison), and E. Clarke, jun. (4 Douglas sc.).

THE SCOTTISH SIX DAYS.

THE Scottish Six Days officials have now covered the major portion of the route, which, they affirm, presents no great difficulties. At all events we are assured that they were able to maintain an average of 10 m.p.h. over the major portion of it, and that this time includes the removal of a heavy Buick car from a deep ditch in the dark at no great distance from Otter Ferry. One of the hills to be included is Ballochandrain, and this, we are informed, was selected chiefly on account of its name, which, the Scotchmen think, will please their Sassenach friends, and, perhaps, enable them to cultivate an accent which will certainly get them into the London Scottish for the next European disturbance. Near Inverness another interesting hill was found.

The rules are now printed, but have yet to be submitted to the Manufacturers' Union. No trouble in this direction is anticipated, as the rules are relaxed and the new portions of the route have been investigated and found to contain nothing deadly. It is probable that an interesting innovation will occur in this year's Scottish Six Days, but we are not as yet at liberty to publish particulars.

THE NETHERLANDS AUTOMOBILE SHOW.

VERY few British motor cycles were exhibited at The Hague show last week, although they outnumbered the representatives of other countries. A 4 h.p. Blackburne attracted special attention by the fact that it had won the first prize in the Winter Trial, and had, it was claimed, covered a distance of 13,125 miles without replacement of any kind. The Megola five-cylinder rotary, described elsewhere in this issue, and a German make—the Ardie—a single-cylinder two-stroke of 3 h.p., were the only new machines. The following motor cycles represented the various nations:

GREAT BRITAIN.—Woolèr, Norton, Blackburne, Matchless, Douglas, A.J.S., Sun, and Scott.

AMERICA.—Henderson, American X, Reading-Standard, Briggs, and Stratton.

FRANCE. — A.B.C. SWITZERLAND. — Megola. BELGIUM.—F.N. GERMANY.—Ardie.

T.T. NOTES AND NEWS.

Preparations well in Hand for the Isle of Man Races. Course in Good Condition.

WE recently had a conversation with Mr. T. W. Loughborough, secretary of the Auto Cycle Union, who has just returned from the Isle of Man. He reports that the roads round the T.T. course are in a better condition than he has ever seen them before.

Improved Notice Board.

Mr. Loughborough has hit upon rather an ingenious scheme, which will be of considerable help to the spectators of the races. On the notice-board there will be an indicator above the number of every competitor. As soon as his presence is signalled half a mile away, the indicator will show above the number, so that the spectators will be able to see, not only that a motor cyclist is approaching, but exactly who he is. As soon as the competitor has passed, and his time has been posted, the indicator will disappear.

Country Headquarters.

It has been the custom in the past for a great many competitors to congregate in Douglas, and outlying headquarters have seen comparatively few. In view of the fact that in the past Douglas has always had the lion's share, it is suggested that competitors may care to install themselves in country headquarters, where they could work more quietly on their machines and under pleasanter conditions. Many of the villages would heartily welcome the installation of these.

Limiting the Number of Competitors.

An ingenious scheme has been instituted so that the number of entries for the T.T. races will not exceed the maximum permissible for safety—that is, one hundred in each race. If the maximum is exceeded, the entries will be limited in the following manner: Entries will be grouped into two sections—(1) entries from manufacturers and (2) other entrants. Group 1 will be arranged according to the number of entries per entrant. The firm having the greatest number of entries will have its list reduced until it equals the next largest entrants. This process will be continued until the required reduction has been obtained, or until no manufacturer-entraut has more than three entries. If, in spite of this reduction, the limit is still exceeded, Group 2 will be similarly dealt with: but in this case the reduction will be continued until no entrant in Group 2 has more than one entry. In the improbable event of a further reduction being called for, Group 2 will be further pruned by arranging the entrants according to the make of machine nominated, and cutting out the latest entries of the most largely represented make of machine.

CLUB NEWS. (Continued from page 461.)

Leeds and District M.C.

Held last Saturday in the rain a handicap hill-climb resulted as follows:

SOLO CLASS.—1, A. C. Thornton (6 Ariel), 34½s.; 2, G. Hill (3¾ Scott), 36½s.; 3, W. R. Brooks (2¾ Blackburne).

SIDECAR CLASS.—1, R. Cawthorne (4 Norton sc.), 40½s.; 2, R. J. Brown (4 Norton sc.), 46s.; 3, T. Hardy (6 Enfield sc.), 51½s.

North Wales M.C.C.

Detailed results are now to hand of the reliability trial held on the 2nd April, and which included Alt-y-Bady.

1, A. E. Bromley (4 Triumph); 2, A. E. Hughes (4 Triumph); 3, W. Edwards (4 Triumph).

The team prize also goes to W. Edwards, A. E. Hughes, and R. Edwards (4 Triumphs).

North-west London M.C.C.

The fuel consumption trial was run off on Saturday over a give-and-take triangular course at Stanmore. A measured supply of petrol was used till consumed, the last "live" competitor providing the winner. This arrangement maintained the interest through the trial. Results:

	M.P.G.	Ton M.P.G.
1. W. P. Cooper (3½ Sunbeam)	124.84 ..	23.45
2. C. C. Labin (4 Indian Scout)	87.86 ..	20.00
3. H. James (3½ Norton) ..	88.00 ..	15.54

Surbiton and District M.C.C.

A misplaced arrow in the route of the half-day trial on Saturday reduced a field of forty-eight to twenty-eight before the first circuit had been completed. On the second circuit T. O. M. Sopwith, H. G. Hawker (both astride the new Hawker lightweights), F. C. Townshend, and V. Gayford (6 Zeniths), made excellent ascents of Pitch Hill. The final results were as follows:

CLASS A. (Solo Machines up to 400 c.c.).—Silver medal, T. O. M. Sopwith (2¾ Hawker); bronze medal, H. G. Hawker (2¾ Hawker).

CLASS B. (Solo Machines up to 750 c.c.).—Silver medal, V. Gayford (6 Zenith); bronze medal, F. C. Townshend (6 Zenith).

CLASS C. (Solo Machines up to 1,100 c.c.).—Silver medal, C. H. Moccatta (7-9 Harley-Davidson); bronze medal, L. Gummer (8 Zenith).

CLASS D. (Three-wheelers up to 750 c.c.).—Gold medal and Dale Cup, H. E. K. Sawtell (10 Morgan); silver medal, Vivian Olsson (7-9 Indian sc.); bronze medal, H. F. Edwards (3 Enfield sc.).

Bath and West of England M.C.C.

One slight correction appears in the official list of awards of the recent twenty-four hour trial.

Young Cup, E. W. Spencer (4 Omega); gold medal, L. G. Williams (3½ Norton).

Catley Cup, A. E. Simms (4 Norton sc.); silver medal (special award), W. Gunning (4 Norton sc.).

Heaton Moor and Altrincham M.C.C.

Some excellent speeds were recorded at the joint speed trials of these clubs, as the following results show:

250 c.c. CLASS.—J. Bennett (2¼ Levis), 36.4 m.p.h.

350 c.c. CLASS.—F. Bamford (2¾ A.J.S.), 54.8 m.p.h.; F. Slack (2¾ Verus-Blackburne), 51.5 m.p.h.; A. Beswick (2¾ Omega-Jap), 41.1 m.p.h.

550 c.c. CLASS.—A. Matthews (3½ Norton B.S.), 54.2 m.p.h.; B. Rowley (4 Triumph), 53.9 m.p.h.; T. Hulme (3½ Rudge) and F. Slack (2¾ Verus-Blackburne), 51.1 m.p.h.

750 c.c. CLASS.—J. Hudson (5-6 Zenith), 58 m.p.h.; A. Matthews (3½ Norton B.S.), 57.4 m.p.h.; B. Maddeu (4 Norton), 56.8 m.p.h.

UNLIMITED CLASS.—F. Bamford (2¾ A.J.S.), B. Madden (4 Norton), and J. Hudson (5-6 Zenith), 57.4 m.p.h.

Eastern Valley M.C.C.

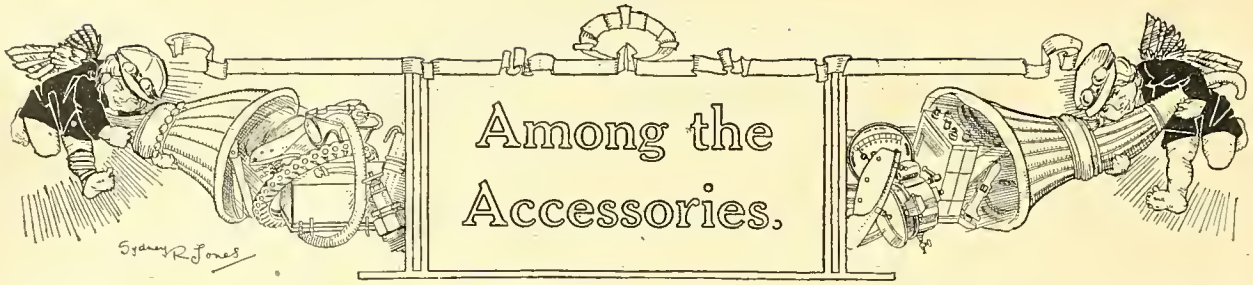
There were thirty-one entrants for the slow hill-climb held on Thursday, April 7th. The results are as follows:

SOLO CLASS.—1, W. Furnell (4 Douglas), 7m. 10s.; 2, Crad. Smith (4 Douglas), 4m. 57s.; 3, H. Jelly (4 Norton), 4m. 48s.

SIDECAR CLASS.—1, A. Rees (6 Zenith sc.), 5m. 28s.; 2, M. Powell (6-7 B.S.A. sc.), 4m. 31s.; 3, W. H. Oliver (8 British Excelsior sc.), 4m. 20s.

Bradford M.C. and L.C.C.

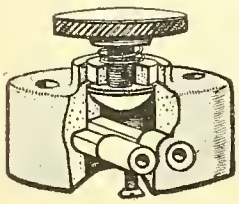
Results are now to hand of the reliability trial for novices, held on the 3rd inst., and are as follows:



1. Triumph Cup and Gold Medal.—S. M. Haigh (6 Ariel sc.).
2. Silver Medal.—G. Scott (4 Triumph sc.).
3. Bronze Medal.—H. Harrop (3½ P. and M. sc.).

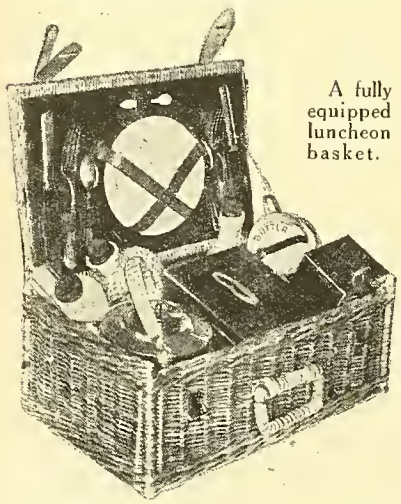
Eastern Centre A.C.U.

A meeting of the clubs in this area was held at Cambridge when the Centre was duly formed.



B.S.A. and Douglas machines at the start of the half-day trial of the Surbiton and District M.C. held last Saturday.

A Neat and Simple Switch.

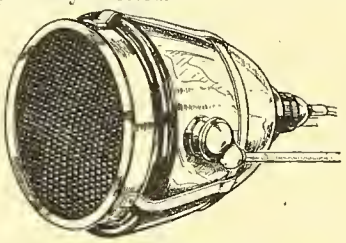


AN exceedingly neat lamp switch has recently been brought out by Messrs. A. H. Hunt, Ltd., H.A.H. Works, Tunstall Road, East Croydon, Surrey. It is of the screw type, and is extraordinarily well insulated. The fact that it has to be screwed down to make contact prevents the switch from working loose, and always ensures a good electrical connection. It is intended to be used as a dashboard fitting for a sidecar.

Screw type lamp switch.

For Picnicking Enthusiasts.

SELFRIDGES, of Oxford Street, London, sell this exceptionally complete and well-made luncheon basket, which has been designed specially for motorists. Among its ingenious features

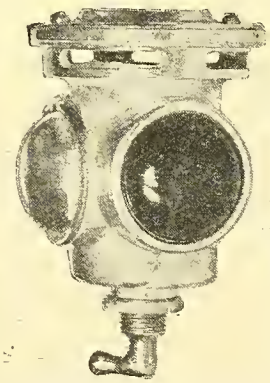


A fully equipped luncheon basket.

are a leak-proof kettle, which may be used as a water-carrier, and an air-tight butter pot.

An Anti-dazzling Screen.

MESSRS. H. TERRY and Sons, Ltd., Redditch, is the latest firm to attempt a solution of the "non-dazzling head lamp" problem, and its honeycomb device (illustrated) has the added advantage that it may easily be fitted to existing lamps.

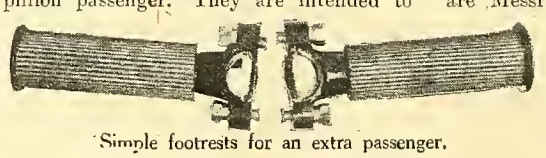


A test of the Terry anti-dazzle screen, as it is called, seemed to indicate that, while it does definitely reduce glare, the illuminating efficiency of the lamp is not appreciably affected.

The Terry Anti-dazzle Screen fitted to a motor cycle head lamp.

Messrs. Terry have also introduced a little device which they term a rear lamp burner cleaner. In brief, it consists of an adapter by which an inflator may be used at each end of the burner, and, incidentally, the little accessory makes a capital case in which to carry a spare burner.

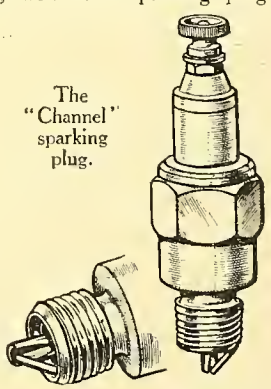
An Aluminium Rear Lamp.



Brown Bros.' new aluminium tail lamp.

AN aluminium tail lamp of substantial manufacture, consisting chiefly of one shafting, has recently been introduced at a low price by Messrs. Brown Bros., Ltd., 15, Newman Street, London, W.1. The burner is easily detachable, and the lamp is fixed to the rear number plate by means of square-headed bolts passing through a portion of the casting.

For Pillion Passengers.



THE footrests illustrated are known as the "Venus," and have been designed to give comfort to the pillion passenger. They are intended to be fitted to the motor cycle chain stays, and should not only add to the comfort but also to the safety of the passenger riding on the carrier. They can be supplied to suit any machine, and are made by Venus Motors, 52, Plashett Road, Upton Park, London, E.6.

Simple footrests for an extra passenger.

A Coated Mica Plug.

SOMETHING of a novelty in the way of a plug has recently been placed on the market after some years of experimental work. To all outward appearance the "Channel" plug is a normal, well-made sparking plug of the

The "Channel" sparking plug.

non-detachable type, with mica insulation. It contains, however, features of considerable interest. Mica in itself is an admirable insulator, but the multitudinous layers which compose the insulation of a plug are somewhat liable to permeation by moisture, especially under pressure. In the case of the "Channel" plug the mica is protected by a coating composed of a special lacquer which extends to the central electrode. It is claimed that the lacquer is impervious, and is unaffected by the temperature of the explosive mixture. In addition there is little fear of internal short circuits due to carbon deposit, since the lacquered electrode prevents deposition on the bare metal, the lacquer itself being a good insulator. The name of the plug is derived from the fact that a channel groove is milled in the central electrode, and it is pointed out that the spark oscillates about the face of this channel, giving remarkable self-cleaning properties.

The distributing agents for this plug are Messrs. the Agency Corporation, of 9, Oxford Circus Avenue, London, W.1, who state that the plug has been designed for general utility purposes, and is suitable for hard work on all normal types of engine.

B.H.S.

NOT ONE OILED UP

OUT OF THE TENS OF THOUSANDS IN USE.

No. 1-D.
6/- ea.

No. 1. (new series) same construction, non-detachable, 5/- ea

Since the introduction of this plug six months ago, not a single instance of one being oiled up has come to our notice, neither from users, nor from cars and motor cycles under our observation.

The secret of this lies in the long flame swept core on which it is impossible for carbon to adhere in sufficient quantities to cause short circuiting. Exceptionally hot running is catered for by the unique design and heavy construction of the centre electrode and outside point, and since the former is provided with a nickel cased head, scaling, with its attendant pre-ignition, is eliminated.

FIT THEM TO-DAY AND SAVE TROUBLE.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Meter Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Meter Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

"Quality & Service"

Kensington High Street.W.8

Another 100,000 LEATHER JERKINS

When we first announced the purchase from the Government of these most serviceable garments, we were inundated with thousands of orders—indeed, the demand was so colossal that we unfortunately, had to disappoint thousands. Now, after lengthy negotiations, we have succeeded in securing the

ENTIRE GOVERNMENT STOCK

and this week we offer the second parcel of 100,000. Men who served in the R.A.S.C. know the wonderful wet and wind-resisting qualities of these Jerkins. Every seam is double stitched, and the buttons can neither come off nor pull through the material.

In the finest quality tan leather, soft and pliable, yet extremely durable. They are full size and reach below the waist, and are lined with warm, fleecy woollen material. For motor drivers and cyclists, tramwaymen, postmen, etc., and can be worn under a coat quite easily. The splendid quality l ather can also be put to other uses, viz., Slippers, strong Driving Gloves, Upholstery, Bookbinding, etc. Less than one-third the cost of production.

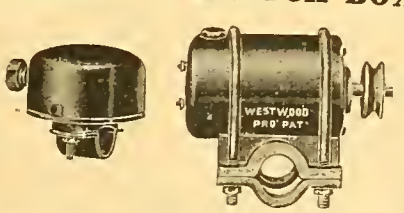
"DAYBEAM" Electric Solo Set

The Headlamp supplied with this set is our 5in. Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

Complete Outfit, List No. 30/1, Price £5 5 0
(If tail lamp is not required, deduct 12/6).



"DAYBEAM" Combination Set

The set comprises Daybeam 5in. Headlamp, Ideal Sidecar Lamp, and Torpedo S.B.C Tail Lamp. Each lamp is fitted with an independent switch, and is finished in ebony black with nickel-plated relief. The Accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting and will give very satisfactory service in use. Many have now been in use two or three years, and are as efficient as when first purchased. **All our Accumulators are specially made to stand vibration.** Ordinary accumulators are never satisfactory for motor cycle work. The hard wood case supplied with this set is finished ebony black, and is specially treated to withstand acid. This outfit is despatched completely assembled with bulbs and all necessary wiring, etc.

Complete Outfit, List No. 30/2, £7 7 0.

DYNAMO & SWITCH BOX

The Trial for Stock Machines.

SINCE closed trials in the Midlands have been attracting over 150 entries, it may appear strange that next week's one-day trial, organised by the Auto-Cycle Union, should secure support from only about one-third that number. No doubt the threat of a transport strike had something to do with the comparatively meagre support, but there are other factors which in fairness to the official body should be considered.

In the first place, the closed trials referred to were organised in the heart of the industry, where so many pseudo trade riders are so full of enthusiasm. In the absence of "official" support from the manufacturers, a retirement is not an important matter, while to win means good advertisement. On the other hand, an A.C.U. trial is altogether more serious, and, owing to its technical nature, more tiresome, which discourages the private owner who is so attracted by trials of a sporting nature. Further, there is the stock machine innovation which causes some makers seriously to think, while not a few could not name a number of agents who have in stock a full range of their models.

Those who could not consider seriously entering stock machines would hesitate before entering their competition stud in case a misunderstanding public should draw erroneous conclusions.

Everything considered, therefore, one may regard the entry of fifty-four for the A.C.U. trial as satisfactory; and the fact that no fewer than eleven manufacturers have entered stock machines—some of them teams of three—is a tribute to the quality of present-day motor cycles and the faith of manufacturers in their standard productions.

On the other hand, it is somewhat surprising that so few manufacturers of four-wheeled cycle cars conforming to the F.I.C.M. definition have entered their machines. We long urged that these little vehicles which compete in price with motor cycles should be able to prove themselves to be their equal in performance, and the lack of entries in this trial, which gives their sponsors an opportunity of demonstrating them under equal conditions on the road, may cause the public to draw invidious conclusions.

Speed.

WHO will be the first to accomplish a speed of 100 miles per hour with a 500 c.c. engine? This question is already heard amongst those groups of enthusiastic motor cyclists who gather to discuss their favourite sport. Record figures for the flying kilometre are gradually creeping higher and higher, and already an enterprising manufacturer has offered a special trophy for the first machine to reach the magic figure. The present figure of 92.44 m.p.h. leaves an increase of nearly 8 m.p.h. to be obtained, and though several capable judges consider that the 100 m.p.h. mark will be passed before the close of the year 1921, yet it should be remembered that every little increase in speed requires much careful thought and experiment. At first sight there would appear to be two obvious methods of increasing speed. (1) To increase engine efficiency at high revolutions; (2) to decrease resistance by streamlining both man and machine. The first question has, of course, received so much attention at the hands of our best designers that it becomes increasingly difficult to improve on present-day performances, and a very considerable increase of power will be required to accomplish these extra miles per hour. The second alternative is perhaps worthy of more consideration than it has yet received, though it presents admittedly difficult problems. All Brooklands riders of experience know the importance of lying flat so as to present the least possible head resistance, but it might be possible to decrease, by fairing, the vacuum formed behind the rapidly moving body. The suggestion is not a new one, and originally appeared in *The Motor Cycle* some nine years ago, though it becomes of increasing importance as the speeds of racing motor cycles become higher.

An index to the advertisements in this issue will be found on the page facing the back cover.

Crack Speedmen Wanted.

I HEAR that several of the motor cycle firms who have done no racing since pre-war days, and are now reviving this form of advertisement, have experienced considerable difficulty in unearthing the requisite jockeys. Of course most juvenile motor cyclists are apt to fancy they could beat George Dance if they had something as hot to sit over; and—equally of course—it isn't the easiest thing in the world to recognise a potential super-speedster when one meets him in the flesh. I am not going to enter into any correspondence over this matter or offer any introductions. But if any young and ardent reader believes in his own powers, and can hit upon a knack of convincing worried, busy, and hungry competition managers, I believe there are several good jobs of this sort going in the Midlands for the right man.

The Future of Sopwiths?

I WAS in the Sopwith works the other day. A deep impression of tragedy was created by the sight of this magnificent plant running on a small throttle opening, so to speak, and equally by the sight of the gorgeous A.B.C. machine, so largely strangled by high production costs and the general trade depression. The weekly output of new A.B.C. machines still reaches double figures, there are tons of spare parts in stock, and repair work is going on just as usual. But of course no very definite scheme of reorganisation is possible while trade remains so bad. Wages and material costs are dropping rapidly. The A.B.C. has never been listed at more than £150, even when wages were at their zenith, and every ounce of material had to be bid for in the teeth of a raging demand and a famine of supplies. One presumes that when normal conditions return this fascinating 'bus could be turned out at about £75. What a seller it would be at that figure.

Naked Chains.

ANYBODY who has motor cycled in a dark suit on a dusty day must conclude that the only method of keeping dust out of the bearings of a naked chain is to keep those bearings so full of lubricant that there is no room for foreign matter in the clearances. If dust will permeate, as it does, into the microscopic clearances between the threads of the closest-woven cloths, it will obviously penetrate into chain bearing clearances at the arcs which are not under pressure. If the chain is kept oily externally, as Mr. Evans and many other advisers suggest, the main function of the oil will be to render the dust glutinous, and prevent some of it from being blown clear by wind pressure. There is something to be urged in favour of a dry brush, which will clean off a certain amount of dust at each revolution of the chain; but I do not believe that any oil squirted on to the brush will do good. My own practice is to lubricate the innards of the chain as often as I can muster the energy to remove it and soak it; but to keep its exterior surfaces as dry and clean as possible. For these reasons I infinitely prefer the enclosed chain, even if the casings are apt to rattle and are awkward to re-fit.

Gingered Baby Two-strokes.

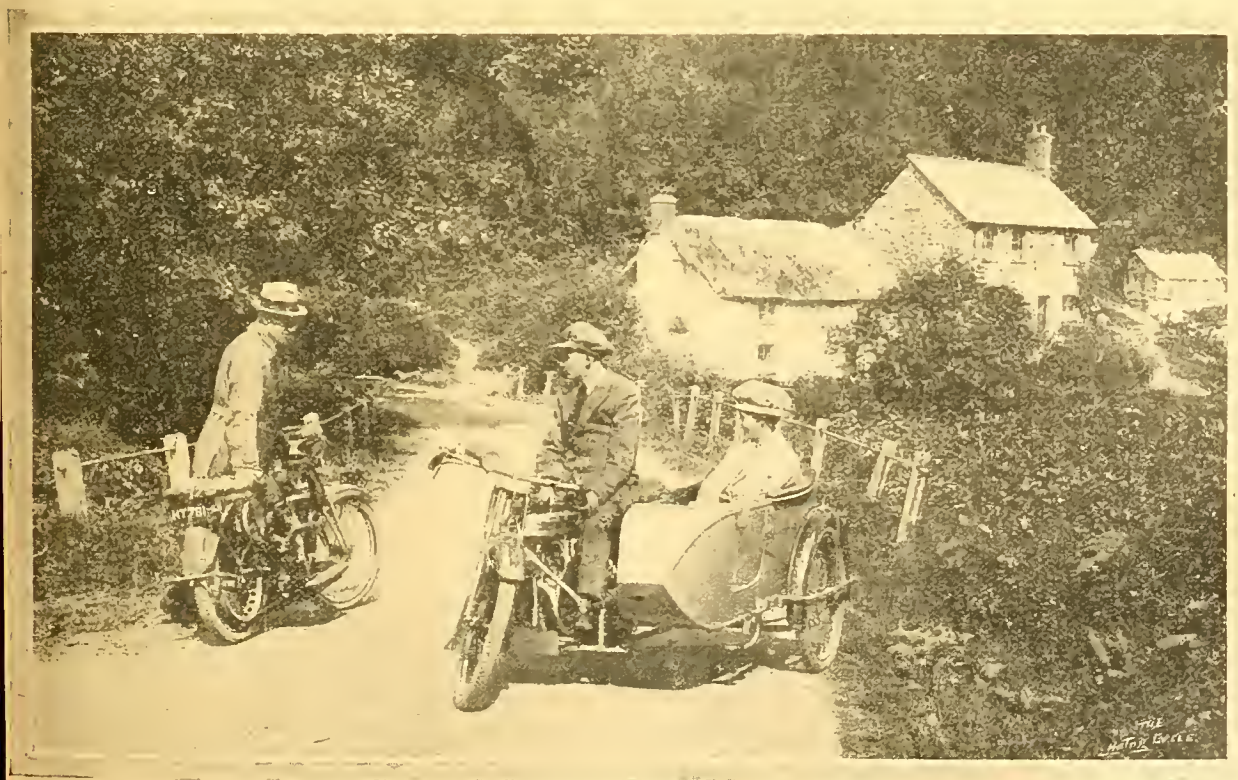
A LITTLE care is advisable in ordering a single-geared baby two-stroke nowadays. As everybody knows, the two-stroke engine seldom possesses such a wide range of r.p.m. as the four-stroke. Just at present there is a demand for rather more powerful babies. Some designers meet the demand by giving us bigger engines; others give us engines with a wider range of r.p.m.; and others "hoist" the range by giving us engines which will run faster than the old type, but which will not run so slowly. I have been out this week on a baby which, in delivery tune, cannot be induced to fire regularly at less than 16 m.p.h. on a 5 to 1 gear, and from what I hear there are others like it. If such engines have a gear box behind them, their high minimum r.p.m. are of no great account; but if they are single-geared, they are regular hogs. I have not yet had time to discover how far the fault can be amended by special carburetter tuning, but complaints of this type have reached me from several sources.

Evil is Wrought

BY want of thought, as well as by want of heart. M'yes. My new machine arrived with an advice note on which the words "inflator to follow" were duly carboned. I thought nothing of the omission until I took the road. Thanks to the fact that high wages have enabled all my kitchen varlets to purchase push bicycles, there wasn't a solitary tyre inflator left in my garage. One can always stop a push cyclist, I reflected. After a few miles my back tyre grew a thought soggy. I stopped a push cyclist. I much disliked the job of inflating a 2½in. tyre with a pump about the size of a fountain pen. At the next burg I ransacked the three motor cycle garages. I found one rather inferior pump at the last dealer's which I visited, and paid 9s. 6d. for it. By this time I was feeling ripe for a pungent comment on the subject. Next morning the missing inflator arrived by post, and I soon realised why it had not accompanied the machine by rail. Two nice little pegs had been brazed on the frame to accommodate it. Next morning the designer had designed a pair of leg shields. The stays of these shields prevented the pump from being inserted in the clips. He couldn't think of anywhere else to put it. Having owned an A.B.C., I

Ixion's "MOTOR CYCLE REMINISCENCES" have lately been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

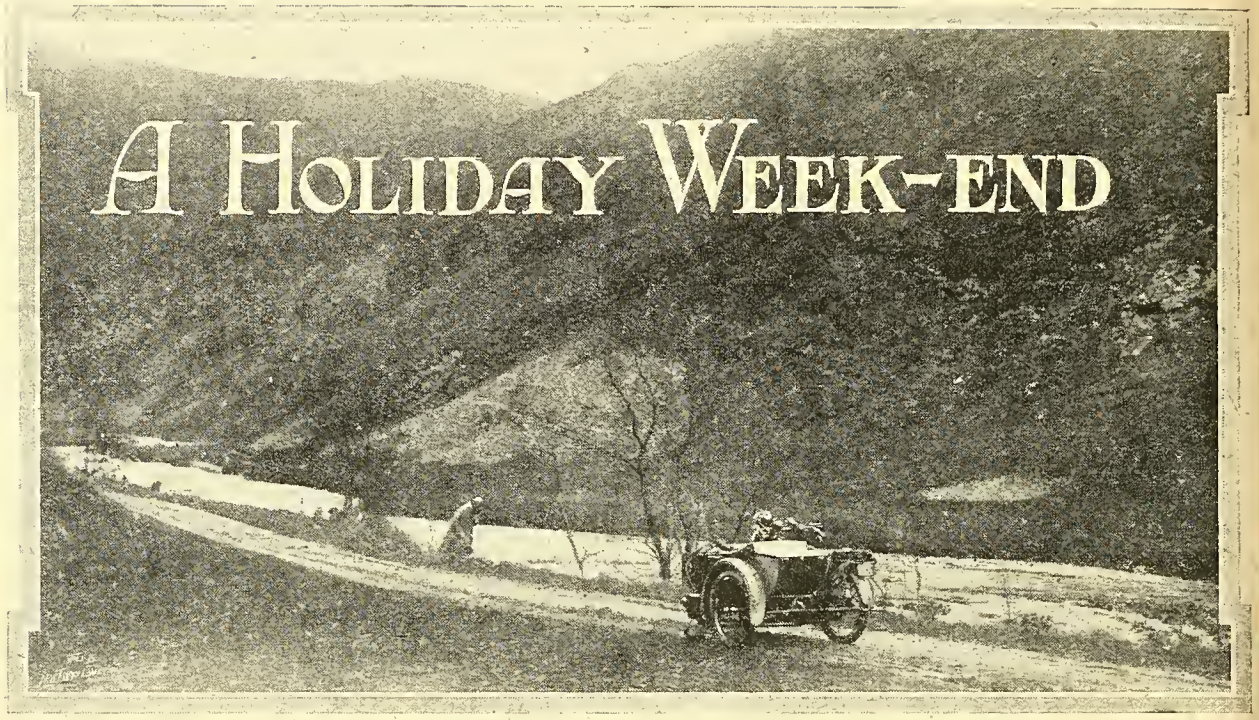
Occasional Comments.—



propose to mount my inflator clips on the leg shields. But for the moment the pump reposes in the side pocket of my reefer jacket, where it is so comically in the way that I am now composing a film scénario for Charlie Chaplin, in which much comic business arises from a motor cycle inflator carried in a side pocket.

Streamlining Our Racers.

THE last Brooklands meeting showed that fierce competition in the light car world has forced scientific streamlining on all would-be top-notchers. The modern Brooklands edition of a 10 h.p. car is not more than 20in. wide across the body, and is faired off so subtly that not even a rivet head protrudes from its rotund tummy. H. G. Hawker, the Atlantic flier, is by no means a giant, but he could only get into the cockpit of his track A.C. by adopting the sort of attitude in which Annette Kellerman dives, and then getting a hefty friend to pick him up and poke him in, feet foremost. When Hawker was safely ensconced, the top 33% of his head was the sole excrescence from the entire area of the 'bus. I can see the day coming when not even the driver's head will protrude. He will lie on his abdomen inside the bonnet, and scan the track through eyeholes in the radiator, which holes will be carefully streamlined with Triplex glass. Motor cycle racing is crude by contrast. Look at the photographs of Judd and O'Donovan on their Nortons in *The Motor Cycle* for April 7th last. If Hawker's A.C. is faired as carefully as a Sopwith-Snipe aeroplane, the Norton is as bristly as the old Rumpetty schoolplane, which was said to be perfectly rigged when a canary could not find its way out. If an unstreamlined Norton can beat 92 m.p.h., what will the 500 c.c. record be when motor cyclists take to streamlining?



Top Tube Tool Boxes.

MY latest 'bus carries its tools in a neat metal case on the top of the tank, instead of in the usual stern carrier bags. The design is probably dictated by motives of economy. Sheet metal is cheaper than leather, and one box is far cheaper to produce than two bags. For practical reasons I prefer the tank box. The contents are ready to hand when one wants them, and the box is free from the rather annoying vagaries of pannier bags—lost keys, jammed locks, catches which jerk open and litter the road with your tools, etc. But nobody has ever yet turned out a really satisfactory tank box. Most of them are far too small; the few samples I have encountered will barely hold a rational tool roll, and you have to stack the other extras in your pockets—tyre kit, spare lamp bulbs, spare plug, spare chain links, etc. They want too much packing. Leather may be dear and fail to keep its shape, but at least it isn't resonant. A metal box, when packed with assorted ironmongery, is apt to jangle. You must either stuff it very carefully with rag, or else cement a thin lining of felt to its inside surfaces. I hope that I shall live to see a really capacious tank box, lined with some material which will deaden the sound of the contents. It is a mistake to suppose that these tank boxes necessarily look ugly; they not infrequently add to the good appearance of a machine, especially when the top tube is sloped.

SUNSHINE IN SOMERSET.

A pretty scene in one of the many picturesque lanes of that county. A Douglas solo rider enquiring the way of another Douglas enthusiast.

A Holiday Week-end

Stiff Test of a Stock Machine. 560 Miles on a 6-7 h.p. Ariel Sidecar Outfit.

TO embark upon a business trip of over 400 miles upon a brand new and untested machine, and one, moreover, which is quite unfamiliar to the rider, is the sort of happening that frequently falls to the lot of the motor cycle writer.

From Coventry to Richmond (Yorks.) was the journey, and the machine was a chain-driven 6-7 h.p. Ariel twin sidecar outfit; and it acquitted itself so well as to leave in retrospect one of the most pleasurable outings ever undertaken in the quest of "copy" for the pages of *The Motor Cycle*.

Richmond on Good Friday is the annual meeting place of north-country motor cyclists, and the writer planned to make the greater part of the journey there on Thursday, and to that end visited the Ariel works in Birmingham on the Wednesday afternoon, only to find that the expected machine was still awaiting its finishing touches; it was finally driven away just in time to make Coventry before lighting-up time.

A Standard Machine.

No special preparation had been given to the outfit, except the fitting of an acetylene lighting set, and it was untested—the run from Birmingham to Coventry being the very beginning of its road life.

Having listened to strict instructions regarding easy running for the first fifty miles, the engine was nursed gently on the beginning of the next day's run, when the northward journey, *via* Leicester and Newark, was commenced; at Leicester, however, the temptation of the Fosseway was too great, and, as the long-stroke twin engine appeared to like it, the throttle was opened and the stretch of thirty-one miles covered in surprisingly quick time.

An examination of the petrol tank at Newark revealed the fact that sixty miles' running had absorbed the two gallons put in at the start, and this high consumption was only slightly improved during the next two days on the road. (It is only fair to say that the carburetter was not the automatic one now standardised.) After Newark, excellent time was made to Doncaster, the Great North Road being good and the weather perfect. Beyond Doncaster a detour was made through Leeds, and on the vile surfaces between Pontefract and that city the spring seat pillar, efficient front forks, and 28 × 3in. wheels of the Ariel were appreciated to the full. Delaying but a few minutes to make a call, the northward direction was still followed, Wharfedale crossed at Pool, and a little further on the lamps were lit in the afterglow of a perfect sunset. Humphrey Bank, a stiff main road pull near Harrogate, just necessitated a change into second, and a way through the famous northern Spa was slowly threaded, the better to appreciate the effect of its brilliant illuminations, dominated by the electric sign of "The Grand" high up on the hillside over the town.

Ancient Customs.

The day's journey was ended at Ripon, that near-by but much less pretentious watering place and ecclesiastical city, famous for many antiquities and old customs, not least being the horn-blowing at sunset; the horn-blower is a local worthy equipped with lungs "like blacksmith's bellows," who winds three doleful and unbelievably prolonged blasts in the market square at the close of each day.

The meteorological promise of Thursday was not fulfilled on Good Friday, and a grey, dank mist hung

A Holiday Week-end.—

over the country; from Ripon, a short run brings one again on to the Great North Road, on one of its best stretches—Leeming Lane—and all the way to Catterick Bridge the good Ariel thundered along on a generous whiff of gas. During the day, what time some eleven hundred machines were gathered together in the market place of Richmond, the Ariel stood in proud isolation, not being one of the competing machines, but its handsome appearance attracted not a little attention. Owing to official duties, a restart towards the south was not made until the majority of motor cyclists had left the Meet, and a delightful "blind" in the direction of Boroughbridge was enjoyed, despite a spectacle and goggle-obscuring drizzle of rain which made fast driving difficult; along this stretch a somewhat ferocious dust with a "very" Scott driven by the works speedster was satisfactorily settled, thanks to the extra c.c.

IN DERBYSHIRE. Early spring time in the Peak District is apt to be bleak, but the grey hillsides have their charm at all times of the year. The top picture is near Dovedale, and the lower one in the valley of the Dove itself.

and the cool running engine of the Ariel.

On the homeward journey, which was completed on Saturday owing to heavy rainfall on the night of Good Friday, no incident worthy of record was encountered; before leaving the north, however, Pool Bank, near Otley, was climbed as a test. This hill, which averages 1 in 11 for one mile, was climbed almost entirely on top gear, the exception being about thirty yards at the second bend. On the long run back to the Midlands, an

A Holiday Week-end.—

average of 28 m.p.h. was found to be quite within the compass of the machine.

Saturday evening was enjoyed at rest after the 420 miles riding, but next morning the call of the road was again insistent, especially with such an excellent machine available, for a purely pleasure run.

The consumption was improved by slightly closing the jet orifice, but this was rather over-done, and the control became sensitive thereafter, especially against the strong head wind which blew from the north-west and retarded progress all the way to Ashbourne; Dovedale being the objective.

A 'Busman's Holiday.

While having lunch at the "Green Man and Black's Head" (delightful name!) in Ashbourne, the heavens showered down their whole repertoire of nastiness—hail, sleet, rain, and snow—true Easter weather! However, although tempted to turn tail and run home with the wind, the remaining five miles to Dovedale were braved, and, despite heavy showers, the scenery of the secluded valley was thoroughly enjoyed.

On the homeward run, across country, through twisting and undulating lanes, the splendid top-gear pulling of the Ariel engine was a delight, the only delay being due to a temporary cessation of the oil supply for some unknown reason; the hand pump of the Best mechanical system here proved its usefulness. Near Atherstone the lamps were lit, and a gentle pace made over the villainous surfaces around Nuneaton and Bedworth.

Easter Monday was spent in gentle ambling around Warwickshire lanes, bringing up the total week-end mileage to 560, during which no attention to the machine was needed. For sweet running, power, comfort, and the staunch construction which promises prolonged good service, the 6-7 h.p. chain-driven Ariel outfit stands in the front rank. Steering is excellent, mudguarding good, the internal brake in the rear chain sprocket smooth and powerful; the large sidecar is luxurious, and, having ample luggage capacity, is convenient for long journeys—altogether an outfit admirable from both driver's and passenger's point of view. D.H.S.

A New Use for Old Trailers.

A Country Clergyman's Experiences with a Motor-assisted Bicycle as a Passenger Machine.

By REV. F W COBB.

I OWE my introduction to the "Simplex" auxiliary unit to an interesting description of a ride last year from Torquay to Birmingham. 187 miles were covered in the day by a "Simplex" enthusiast, on a lady's model B.S.A. cycle without any mechanical trouble.

After demobilisation as an Army chaplain I found myself in a Surrey village, miles from anywhere, and the "Simplex" unit, which had been purchased from the Portsmouth agents, soon proved its usefulness and efficiency.

Two Up.

Shortly afterwards, a second-hand trailer was picked up for a mere song, and as I was anxious that my wife should, if possible, share the benefit of the little engine's powers, I had the trailer's connecting bar altered to allow of its attachment to the seat pillar of my Royal Enfield pedal cycle.

Perhaps the experiment of such a combination was a bold one. Some might go further and say that with a baby of only 1¼ h.p. I was courting trouble. However, the experiment was made, and 400 miles of winter riding have been covered with this somewhat novel, and certainly very cheap, outfit. All miniature engines have in the nature of things to be watched carefully, and overstrain avoided. This has necessitated steep gradients being walked, and some pedal assistance being given up moderate gradients. But for the rest I cannot speak too highly of the little engine's performances. Frequently a 14 m.p.h. speed has been attained, and both engine and cycle have stood an exceptional experiment remarkably. Petrol consumption works out at about 110 m.p.g.

Without question the most economical method of motoring for two. The Rev. F. W. Cobb and his 1¼ h.p. Royal Enfield-Simplex trailer outfit, which he has found invaluable in a district "miles from anywhere."

At a rally of new and expensive motor cycles, any simple outfit perhaps would appear somewhat antiquated, but it serves my purpose and takes my wife and me to where we wish to go—and brings us back.

T.T. NOTES AND NEWS.

Motoring Visitors to Manxland to be Taxed this Year.

Practising to Start on Empire Day.

From "The Motor Cycle" Correspondent in the Isle of Man.

PREPARATIONS for the forthcoming T.T. Races, which will take place on the 14th and 16th of June, have assumed a definite form since a visit to the Island of Mr. T. W. Loughborough, and the Rev. E. P. Greenhill, of the A.C.U. Competitions Committee. During the visit they saw His Excellency the Lieut.-Governor, Maj.-Gen. Sir William Fry, K.C.V.O., C.B., who promised them every assistance in his power. They also saw the Government Secretary and Treasurer, Mr. B. E. Sargeaunt, O.B.E., the Town Clerk of Douglas, Mr. A. Robertson, and the members of the Highway Board.

The Highway Board consented to the same course as last year being utilised. The start will take place at the Playing Fields belonging to the Douglas Corporation, which were utilised last year, and the builders have received instruction to proceed immediately with the work of erecting the time-keepers' box, the grand stands, and the general enclosure.

Roads in Good Order.

The course on the whole was pronounced by Mr. Loughborough to be in very fair condition; in fact, better than it was at this time last year. The necessary repairs to the stretch running from Sulby to Ramsey will immediately be undertaken by the Highway Board, and the mountain road below Craig-na-Baa, which is the fastest part of the course, will also be put into good condition. It will be remembered that last year the rocks were beginning to jut out from the roadway. These rocks will be blasted away. Practising starts at 4.30 a.m. on the morning of Tuesday (Empire Day), 24th of May, and it will be continued up to the day of the race. The rules for practising are not yet definitely settled, but will not differ much from those in force last year. 1920 competitors will not be required to complete six circuits this year, but the number will be reduced to three, including, of course, the time circuit. Competitors living outside Douglas will be allowed to complete their circuit from the telephone marshal nearest to the place they reside. For example, those living in Peel can start their qualifying circuits and finish them at Ballacraine, but their timed circuit must be done from the official start opposite the Playing Fields, where the official timekeepers will be located. No competitor will be allowed on the course until 4.30 a.m. nor to start the journey to the course before 4.15 a.m., and, after 6.15 a.m., a rider will not be allowed to start a practice circuit.

Safety Helmets.

The wearing of safety helmets during practising and on the day of the race will be compulsory. This will be strictly enforced, as also will be the rule compelling the use of silencers during practising.

Mr. Loughborough pointed out to our Island correspondent that there was nothing whatever to prevent a firm, if it so desires, crossing to the Island at once and practising so long as it complies with the Island laws and regulations.

Competitors and spectators bringing their machines to the Isle of Man, in addition to the shilling tax for registration previously paid, will have this year to pay an additional fee of ten shillings for permission to use the Manx high roads for one month, whilst car owners will have to pay thirty shillings for the same privilege. These new taxes were strongly opposed in the Manx Legislature by the Manx Motor Cycle Club and the local A.C.U. Consul, but without success, and it is felt that the action of the Insular Legislature in imposing these taxes, small and paltry though they may be, will have the effect of preventing many spectators taking their machines with them.

Sunbeams on the Course.

Among other manufacturers' representatives who have recently visited the Island for the purpose of preliminary practising may be mentioned the Sunbeam experts, who spent three busy days on the Island last week. The party consisted of Mr. J. E. Greenwood, the designer of the Sunbeam, T. C. de la Hay, the winner of last year's Senior event, George Dance, Reg. Brown (the amateur who came in third last year), and Bennett, an American with a great reputation on the other side of the Atlantic. The Sunbeams used in these practices were the same as those used last year with different cylinders and pistons. The cylinders no longer have detachable heads, and one of the machines had overhead valves. The speed down the mountains of the side-by-side valve engines was very high, but the overhead valve engine (which has already scored successes in open competition) was the faster. De la Hay was actually using the same front cover on his machine last week as he used in the race last year.

Telephone Facilities.

A very complete telephone system is being installed round the course, and this will be in full working order during practice in the same manner as it will be during the races.

Competitors are urged to drive their machines silently to and from practice.

The warning banners throughout the course will be on wire netting, and this will prevent the possibility of their being blown down, and will stop them flapping in the wind. The banner at Governor's Bridge will be horizontal, and, therefore, invisible; but when it is turned on its axis, so that it can be clearly seen, it will signal to each competitor as he passes that he is on his last lap.

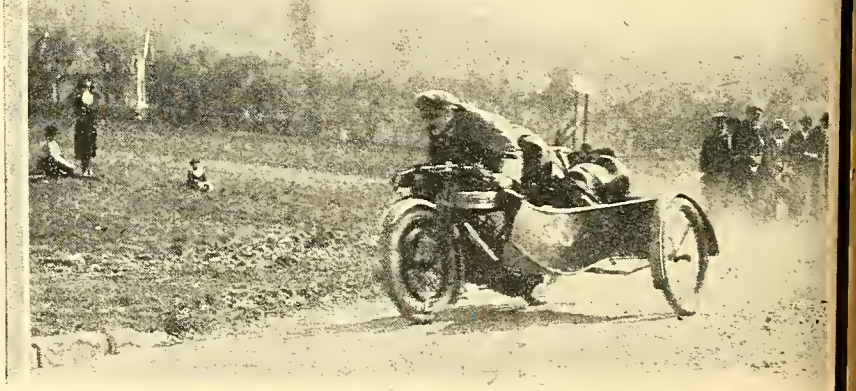
THE MOTOR CYCLE T.T. TELEGRAMS.

In connection with the blue riband event of the motor cycling world, "THE MOTOR CYCLE" has arranged to extend its usual service of T.T. telegrams. It will be recalled that in past years this journal has flashed the results of the race throughout the country by telegram. Post Office regulations will necessarily restrict the number of firms to whom the wires can be issued, and, therefore, all firms who desire to receive the series of telegrams should make immediate application to the advertisement manager of "The Motor Cycle," 20 Tudor Street, London, E.C.4.

A Classic French Hill-Climb.

First Argenteuil Hill-climb since the War. Motor-assisted Bicycles attracting Attention in France. British Motor Cycles win 1,000 c.c. Solo and 500 c.c. Sidecar Classes.

ARGENTEUIL hill-climb, held in the suburbs of Paris on the 10th inst., created a lot of local interest, and united about sixty competitors in the varied classes comprising everything from motor-assisted bicycles to cycle cars. The hill is two kilometres in length, not particularly steep, but having a rough surface (for the road has been neglected during the war), and with three bends calling for skill on the part of the riders. There was not much attempt at organisation, and the few gendarmes who were on duty showed a preference for the places where their presence was least needed. However, by the efforts of the members of the committee, the crowds were kept off the roads most of the time, and the event passed off without accident, though not without a few exciting incidents taking place.



Louis at speed on an Alcyon. He gained second place in the 250 c.c. class.

Popularity of Motor Attachments.

One of the features of the hill-climb was the large number of motor-assisted bicycles which took part, for this class of machine is attracting a lot of attention in France at the present time.

Competition was keen in all classes, and all records went by the board. Fastest time of the day was made by Jolly on a four-valve single-cylinder Alcyon, with 1m. 30s. He was followed by his team mate Lehmann on an identical machine in 1m. 35s. In the 1,000 c.c. class there was a dead heat between Vulliamy on a Rover and Bartlett on a Bartlett-Jap; time, 1m. 35$\frac{3}{5}$s. To determine the winner in this class it was decided to measure the cylinders and give the first place to the rider of the machine having the smaller piston displacement. This verification had not taken place when our report was sent away.

The fastest machine in the cycle car class was a newcomer, the E.H.P., which climbed the hill in 1m. 43s., making an excellent impression. The Grégoire cycle cars which were entered did not start.

Isodi, who, with a Douglas outfit, won the 500 c.c. sidecar event. Observe the inelegant posture of the passenger

A Classic French Hill-climb.—

It is noteworthy that a 500 c.c. machine made the fastest time of the day, at a speed of 50 m.p.h. (approx.).

There were thirteen competitors in the class for motor-assisted bicycles, but only three scooters. Most of the motor cycle classes attracted about half a dozen entries each, but in several there were only two or three. Results are as follows :

MOTOR-ASSISTED BICYCLES.

		m.	s.

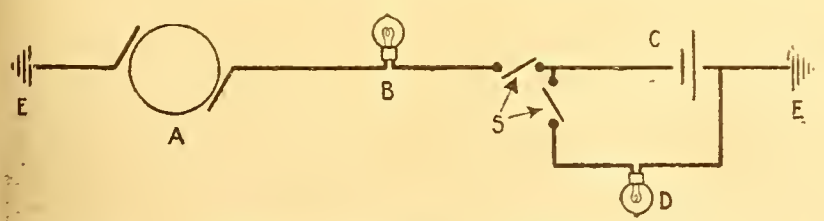
One of the most popular French competition riders, L. Psalty, who attained second place in the 500 c.c. class on a Rover sidecar.



LIGHTING FOR LIGHTWEIGHTS.

As a simple means of generating the necessary current for lighting and ignition, the M-L Maglita has already proved its worth in both large and small sizes. Realising, however, that there is a large demand for a compact set for small machines, the manufacturers have produced a modified form, utilising a small 2 volt accumulator.

The normal Maglita generating instrument is employed, but the current is conveyed to the accumulator *via* the head light, and a 2 volt tail lamp is connected across the accumulator in the normal way. This system automatically provides a bright tail light and a dim head lamp when the machine is stationary with engine stopped, but immediately the engine is started the head lamp gives a bright light, since it receives the current directly from the generator. A slight flicker is observable at very low engine speeds, but at all normal engine revolutions a bright, steady light is produced. Thanks to the self-regulating properties of the generator, no trouble has been experienced with burned-out bulbs, and the use of a 2 volt accumulator permits a considerable reduction in both weight and size of the case.

A single switch knob serves to close both charging and tail light switches, but the accumulator can only be charged with lamps alight.

In accordance with the producers' invariable rule, the lighting set is admirably finished in every detail.

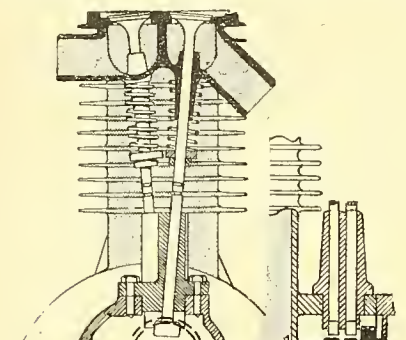
WHERE PRACTICAL KNOWLEDGE INFLUENCES LAW.

A REMARKABLE instance of the value of special knowledge in legal matters is reported from Guernsey, where the A.C.U. local consul, Mr. G. H. Lock, has been strenuously exercising himself on behalf of local motor cyclists. Various undesirable regulations which were proposed by the local authorities have been successfully combated, and Guernsey motor cyclists are enthusiastic in their praise of Mr. Lock's efforts. Conspicuous among the concessions the A.C.U. local consul secured was that motor cycles should be required to carry only "reflex" rear lamps instead of oil or acetylene lights. Mr. Lock's efforts certainly illustrate the very practical value of the personal representation which the national motor cycling body now affords to members in almost every district.



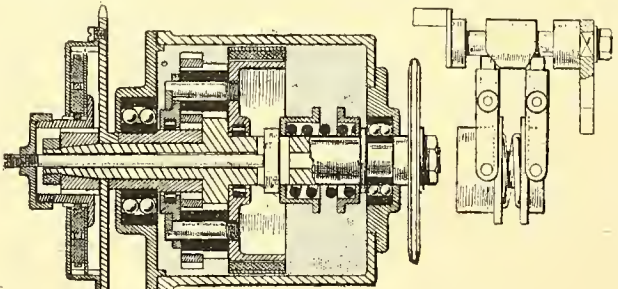
RECENT PATENTS

Reviewed by B. H. Davies

Corona Valve Gear.

THE sketch shows the very neat valve gear used on the Corona engine, and patented by Mr. C. J. T. Oppermann. A hollow camshaft is mounted on a spindle supported at one end in the crank case and at the other by the timing gear cover. This camshaft carries both the inlet and the exhaust cams, and the

Oppermann's valve gear. No. 158,091. 28/9/19.

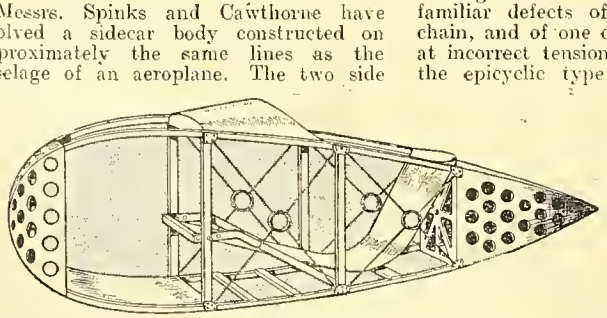


heels of both tappets are brought within its reach by inclining the tappets and valves towards each other, as shown. A particularly neat two-pinion valve gear is thus obtained. The overall width of the engine is very slightly increased, and the "bending" of the gas columns between valve port and piping is fractionally increased.

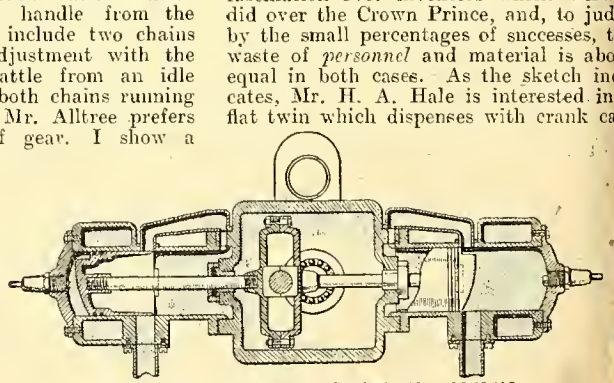
Doorless Sidecar Bodies

Messrs. Spinks and Cawthorne have evolved a sidecar body constructed on approximately the same lines as the fuselage of an aeroplane. The two side frames are built of wood bent into the shape of two pears so as to give a rounded nose and pointed tail. The frame is spaced and stiffened by struts, bracing wires, and plywood panels, and is finally covered with aeroplane linen. I hope they bought a large stock of the latter at a cut rate from Mr. Martin?' The passenger enters by a hatchway on the top, affording a notable exhibition of those pretty stockings which contribute to make the sidecar so popular.

Foolproof Gears.



Mr. Arthur Alltree's name will be unknown to many readers, but his is the anonymous brain behind several successful gear boxes. The motive behind his present patent (an amplification of an earlier design) is tolerably clear. Several motor cycle manufacturers consider that average riders prefer a foolproof gear-change, and that sliding gears are barbarously treated by duffers. The commonest substitute is a gear embodying a friction clutch on each ratio. Such designs are easy to handle from the saddle, but generally include two chains sharing a common adjustment with the familiar defects of rattle from an idle chain, and of one or both chains running at incorrect tension. Mr. Alltree prefers the epicyclic type of gear. I show a section of his gear box. When the plate clutch on the left is engaged, the sleeve and the axle are locked, and the gear runs solid. Neutral position is obtained by freeing the clutch, and low gear by applying the brake inside the box. The detail sketch shows how cleverly a single camshaft is utilised to control the three positions of the lever or pedal. The double cam operates the two forks, of which the left hand fork frees the clutch whilst the right hand fork takes the end thrust of the spring off the main axle. When the camshaft has been partly rotated, the hardened pins in the fork ends enter the parallel grooves on either side of the cam, and the gears are then held in neutral. There are two locking notches in the cam sides. The projecting stud at the extreme left of the camshaft operates the brake which brings low gear into action. As the section shows, the gear runs on ball and roller bearings and should make a very reliable foolproof and durable unit, entailing less weight and friction than systems which have made this type of gear unpopular in the past. This type of gear lends itself to a simple selective control, dispenses with a clutch lever and has a progressive take-up on low.

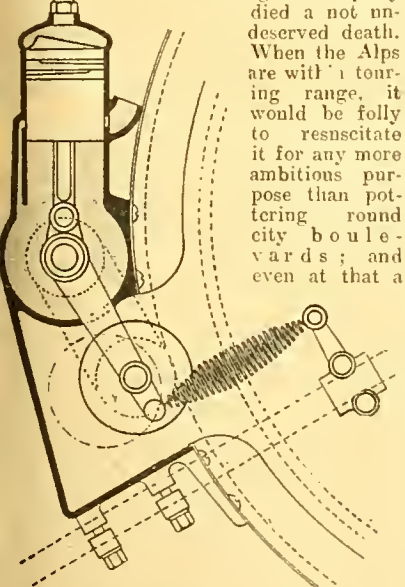


Alltree's gear box. No 140,143. 19/12/18.

Flat Twin Two-stroke.

The two-stroke engine exerts the same fascination over inventors which Verdun did over the Crown Prince, and, to judge by the small percentages of successes, the waste of *personnel* and material is about equal in both cases. As the sketch indicates, Mr. H. A. Hale is interested in a flat twin which dispenses with crank ca

Spinks's sidecar body. No. 145,206. 30/4/19.



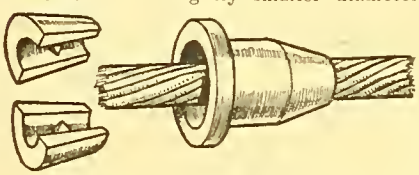
Hale's two-stroke engine. No. 144,852. 10/5/19.

Recent Patents.—

compression. The inner portion of each cylinder barrel is used for the primary compressions. In order to render each of these chambers gastight, the tubular connecting rods are attached to a common cross head, and stuffing glands are used to seal the holes through which the connecting rods emerge from the cylinder bases into the crank case. The crank pin moves transversely within the cross head as the crankshaft rotates. An inventor is not obliged to submit complete drawings, and Mr. Hale does not honour us with his confidence on several technical problems inherent in his engine. If it were constructed in exact accordance with his drawing, the stuffing glands would either wear rapidly, and so destroy the compression, or, alternatively, they would set up tremendous friction. It is possible that he withholds details which overcome these and other difficulties associated with the particular type of engine in which he is interested.

Friction Drive for Auxiliary Motors.

I presume that Signor Leopold Paganelli has an auxiliary motor for push-cycles in mind in propounding yet another version of the friction drive between a small pulley and the tyre or the rim of the road wheel. This particular drive was applied to the 1¼ h.p. Derby machine in this country nearly twenty years ago, and rapidly died a not undeserved death. When the Alps are with in touring range, it would be folly to resuscitate it for any more ambitious purpose than pottering round city boulevards; and even at that a

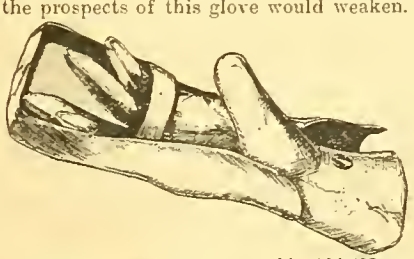


Paganelli's friction drive. No. 156,986. 2/1/20.

better drive could easily be found. His drawing shows a gear of 9 to 1, which chronic slip would probably soon reduce to double figures, so that he must have a very tough (as well as a very tiny) engine in his mind. The friction roller is chain-driven off the engine, and the roller bracket is pivoted, so that the pressure may be varied, for which purpose powerful springs or a screw gear are suggested. A single-cylinder two-stroke engine figures in the drawings. It is astounding that people should spend money on protecting such an idea in the year 1921.

An Emergency Bowden Nipple.

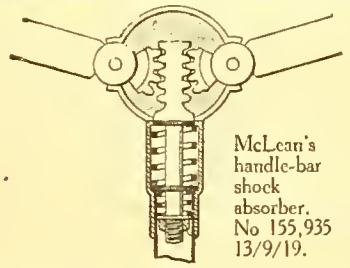
Mr. F. E. Harmer makes a new contribution to the old problem of renippling a Bowden wire in a hurry. We all know that a properly fitted Bowden wire takes a lot of beating, but that a skilled man requires appreciable time to repair such a wire when it has broken or stretched enough to exhaust the mechanical adjustment provided by the makers. Mr. Harmer's emergency nipple can be rapidly applied by any amateur on the road without any tool except a pair of pliers. A pair of tapered cones are slipped along the wire. The inner cone is bored to a slightly smaller diameter



Harmer's Bowden wire nipple. No. 24,133.

than the Bowden wire, is longitudinally split, and is provided with two internal spikes. When the outer cone has been set at the desired point on the wire, the inner cone is forced into it by means of suitable pliers. As an emergency device the gadget should be of some service; but I do not suppose the Bowden people will encourage its adoption as a substitute for soldered nipples.

Waterproof Gloves.

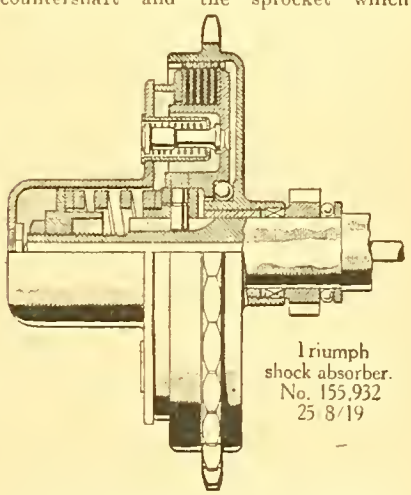


Mr T. Hilton evidently despairs of a direct solution of the waterproof glove problem, and considers that British rubber manufacturers can never follow where the Continental Tyre Co. once blazed a path. He therefore elects to provide an ordinary glove with a special shield of the type shown in the sketch. This shield may be composed of any warm and waterproof material, *e.g.*, patent leather, and is stitched to the glove along a line drawn across the back of the wrist. It projects beyond the finger tips, and its underside is provided with an elastic loop through which one or more fingers may be slipped. The shield will then afford moderate protection to the glove, whilst leaving the fingers free to operate controls. The idea is by no means impracticable, and would certainly keep out a lot of weather. On the other hand, rain, driven by the wind plus the extra impetus due to the speed of the machine, is extremely penetrating; and the Hilton glove can never be either as warm or as dry as a glove made from a wind and waterproof material. As soon as such a material is developed in a sufficiently flexible form, the prospects of this glove would weaken.

Hilton's waterproof gloves. No. 136,483. 24/6/19

Handle-bar Springing.

An Australian produce broker is responsible for the spring handle-bar illustrated herewith. The handle-bar is made in two halves, which are pivoted near the steering head, and secured to a vertical member which oscillates between

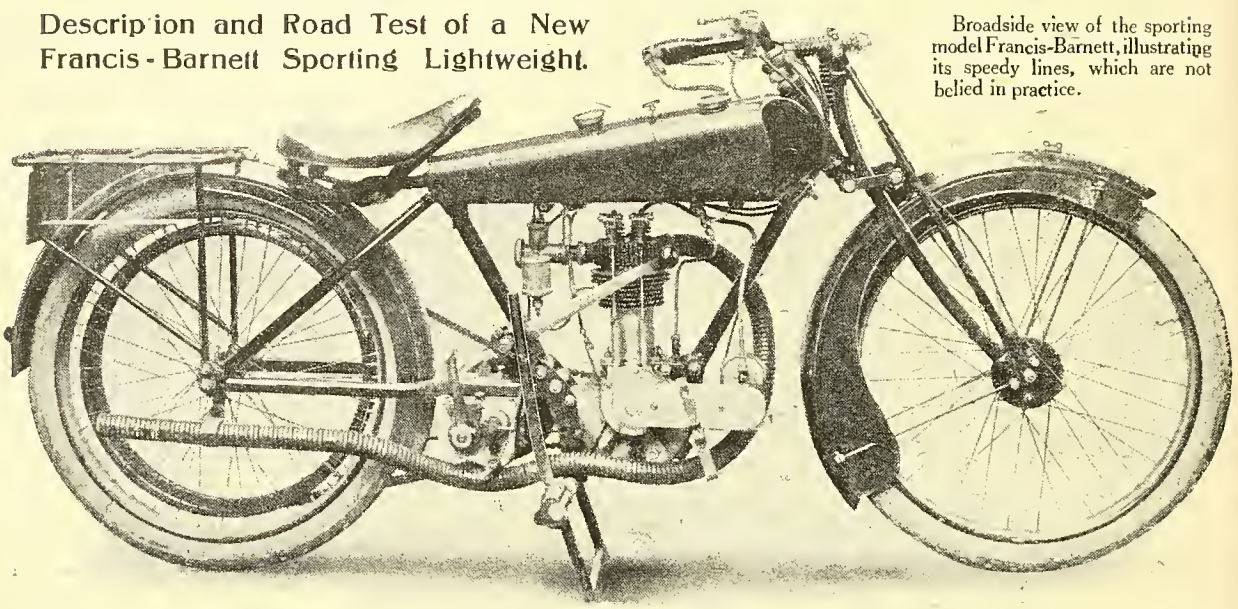


McLean's handle-bar shock absorber. No 155,935 13/9/19.

the pressure of two springs. The plain fact is that a spring handle-bar does not dispense with the need for a spring fork, and that a rigid handle-bar is quite tolerable if the spring fork is properly designed.

A Countershaft Shock Absorber.

We all know that when the Triumph Co. have settled upon a broad design, they hold it up and work at it until every detail is as good as they can make it. So when they adopted the countershaft clutch and gear box, they began to find fault with the ordinary type of shock absorber, which is interposed between the countershaft and the sprocket which



Triumph shock absorber. No. 155,932 25/8/19

receives the drive from the engine. This absorber normally consists of a member which can move endways against the pressure of a strong spring, whenever the drive is jerky. The Triumph experts criticise the ordinary construction in two respects, viz., that it is apt to stick and is expensive to make. The floating member or collar of the Triumph absorber is provided with radial rollers which engage (1) V notches or cam-shaped recesses on the face of the clutch hub, and (2) splines on the driven shaft. The contact is thus of the "rolling" instead of the "rubbing" type, and sticking is regarded as impossible. A glance at the drawing will show that the parts lend themselves to cheap manufacture. If necessary, the device can be constructed so as to ease the main clutch springs under a heavy shock, but this application is not pressed.

EFFICIENCY WITH CONVENIENCE.

Description and Road Test of a New Francis-Barnett Sporting Lightweight.

Broadside view of the sporting model Francis-Barnett, illustrating its speedy lines, which are not belied in practice.

WHEN the sporting clubman ponders upon the purchase of a new mount, he seldom considers anything of less than 350 c.c. engine capacity as likely to be "hot" enough. Yet he is wrong, for there are several lightweights in the 250-300 c.c. class that are both fast and "lively." The new sporting model Francis-Barnett is an outstanding proof of this statement.

Although there are other points that have their bearing on the performance of a "sports" model, an overhead-valved 293 c.c. J.A.P. engine, which forms the power unit, must primarily be given a large amount of the credit attached to big results from a small machine.

Specification in Brief.

As this engine is fairly well known already, it will here suffice to say that it is a clean, workmanlike job, and, mechanically, surprisingly silent and free from valve clatter. (Its exhaust note, on the other hand, is very healthy indeed!)

Other standard fitments include Brampton Biflex lightweight forks, Amac carburetter, a C.A.V. magneto, and a Sturmey-Archer two-speed gear box with clutch and kick-starter, the final drive being by belt. In the remaining details, the Francis-Barnett departs considerably from, and, we venture to think, improves upon, the conventional.

For example, perhaps the biggest bugbear of solo riding—the lengthy process involved in jacking a machine on to the stand at each stop—has been dispensed with. There is a stand, but it is situated amidships, and may be pulled into action whilst the rider remains in the saddle, by means of a long hand lever. Moving off is similarly just as simple a matter; and when not in use the stand is held in a horizontal position, the lever end resting in a spring clip on the magneto chain cover. When on the stand the machine is practically balanced, and the weight of, say, a coat on either end will raise the wheel at the other clear of the ground, as required.

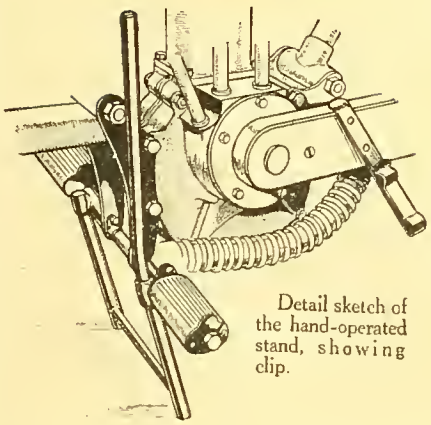
For a lightweight the large saddle tank holds a more than ample supply of fuel. An ingenious syphon arrangement (which has been patented) does away with the necessity of a separate petrol pipe from each compartment.

Finished, down to the handlebars, in all-black, the machine possesses workmanlike, well-balanced lines, and is devoid of those unsightly clips or fitments that so often look like after-thoughts.

Controllability at all speeds, and a natural riding position make jaunts off the beaten track possible.

On the Road.

A short test convinced us that appearances were not deceptive. The riding position is as nearly ideal as we have ever experienced. There is all that sense of having a substantial machine underneath one, and none of that impression of the ridiculous that a tall man sometimes has on a lightweight, and yet nothing could be more steerable or generally handy from the driver's point of view.



At all speeds—and it almost touched "fifty" with us—there is an absence of vibration that makes it a most fascinating mount. The brakes—a generously dimensioned belt rim rear and Webb internally expanding front—are powerful and smooth. The rear pedal is located just where it ought to be.

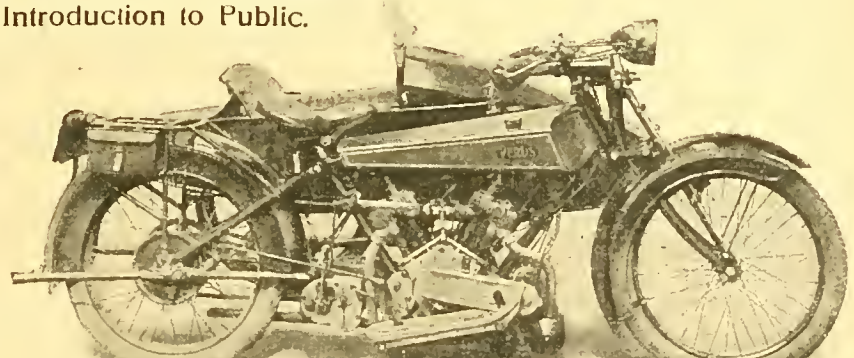
In practice, the stand proved extremely convenient, and surprisingly little exertion is required to jack up the machine; we very quickly forgot to look for convenient kerbstones, as of yore.

Efficiency with Convenience.—

As we have already indicated, the Francis-Barnett is a high-efficiency performer. It is not, however, heavy on petrol. During our test, we did not find it necessary to get out of a rather high top gear. We should imagine that there are very few hills that it would not easily ascend on its standard low ratio.

Since this machine is rated at 2¾ h.p., one is naturally inclined to compare mentally its performance with that of other mounts of the same horse-power. It says much, therefore, for the Francis-Barnett that it survived with honour this most unfair comparison before the writer had fully realised its unfairness. What he momentarily forgot, and what the majority of us are apt to ignore, is that most of the nominally 2¾ h.p. engines now on the market have engines of 350 c.c., an increase of approximately 20% on the capacity of the J.A.P. fitted in this case.

Detail sketch of the hand-operated stand, showing clip.



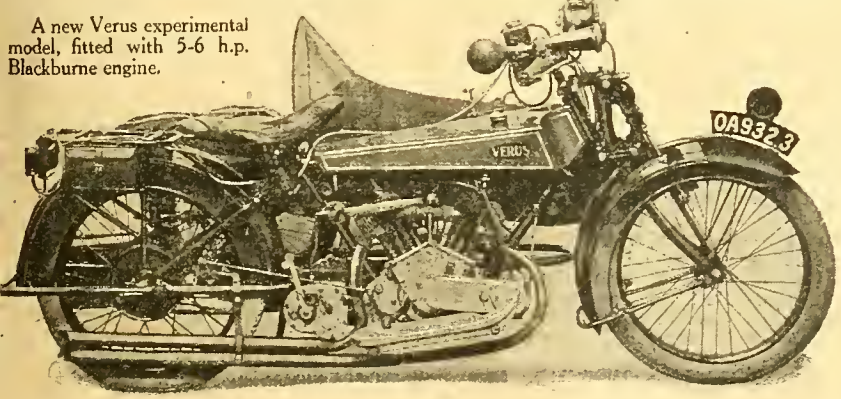
It is, therefore, all the more remarkable that the maximum speed of the smaller machine should be as great as any of the highly developed "pukka 2¾'s" (excepting, of course, one or two purely speed mounts).

Seldom have we come across so fascinating a lightweight, and, without wishing to be unduly laudatory, we failed to discover any point that might fairly be made the subject of criticism, either viewing it as the production model or as an experimental mount. Perhaps the flexible tubing forming the exhaust pipe may shock the fastidious. Personally, we rather like it: it lacks the resonance of copper, and, indeed, has a slight deadening effect on the exhaust note without (practically, if not theoretically) reducing engine efficiency.

VERUS TWINS FOR 1922.

Next Year's Models now on the Road, and will Undergo Many Months' Test before Introduction to Public.

BEFORE the war the name Verus was unknown to motor cyclists, but to a number of makers it was the telegraphic address of an old-established firm upon whom they had long depended for their castings. Although young in reputation, the Verus name on a motor cycle is now well known: even the small boys who make lists of names displayed on differently coloured tanks know the distinctive purple and gold of the Verus. In competitions it has done consistently well, the winning of the Victory Cup being its latest outstanding success, and altogether the machine has gained its place among the firmly-established makes.



Undergoing test. A Verus model, fitted with an 8 h.p. Blackburne engine, that will undergo prolonged trials before being placed on the market.

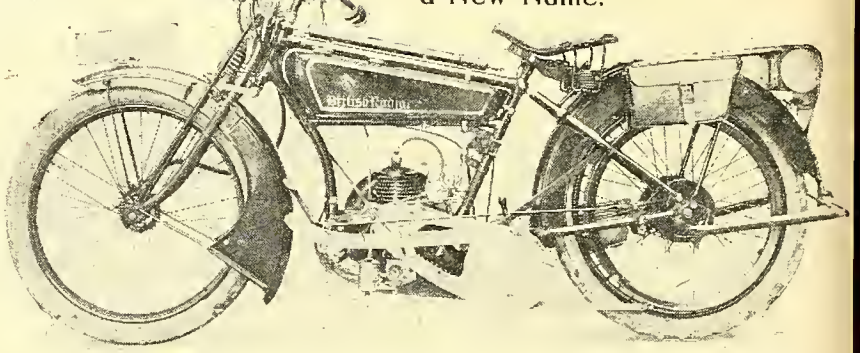
An Extending Range.

Although better known for their lightweights, Messrs. Alfred Wiseman, Ltd., the makers, have given serious attention to larger engined machines. In fact, at the last Show they exhibited a very attractive 4 h.p. sidecar outfit. Next year the Verus range (which at present starts at a 2¼ h.p. two-stroke and ends at a 4 h.p. model) will include two twin outfits which promise to uphold the reputation created by their smaller sisters. The experimental models are now in existence, and will undergo a year's road test before being introduced to the public. One of these is a 5-6 h.p. model engined with a 696 c.c. Blackburne twin—a little-known engine which is, to all intents and purposes, two "2¾ h.p." cylinders on an 8 h.p. crank case. This machine is in daily use by Mr. T. Weaver, of the Verus Co., who, incidentally, won his class at the recent Redditch hill-climb with it.

Trying Them Out.

The companion machine is fitted with the 8 h.p. Blackburne engine, and is in use by Mr. B. Kershaw, the winner of the Victory Cup, who with it was successful in the South Birmingham M.C.C. Easter Trial to Lynmouth.

A new Verus experimental model, fitted with 5-6 h.p. Blackburne engine.



Both mounts are chain-driven, have Sturmey-Archer gear boxes, internal expanding brakes, saddle tanks, and exceptionally wide and well-designed guards. The saddle position is very low—in fact, the apparently long wheelbase is brought about by the construction of the frame. The distance between wheel centres, however, is rather longer than usual, which enhances the comfort when riding on indifferent roads.

There are many interesting details in the frame, the substantial head being one of them; but as many of them will be modified before the models are on the market, no purpose will be served by mentioning others.

In producing these machines—by the way, there are half a dozen of them on the road—so well in advance of the time when it will be necessary to decide upon their ultimate specification, the makers reveal a sound policy which very few follow. If there are any weaknesses or undesirable features in the make up of the machines, the two riders mentioned will find them in time for further experiments to be carried out. In this way, useless stocks of materials will be avoided.

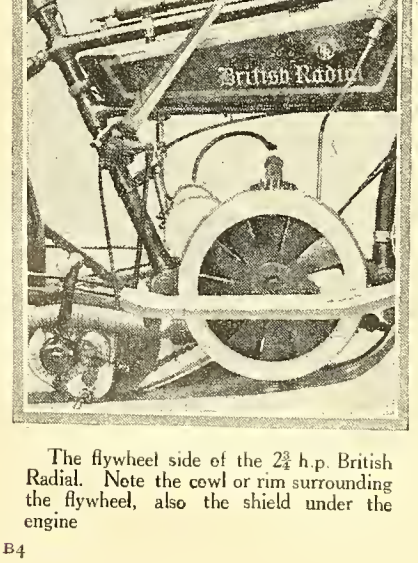
A THREE-CYLINDER LIGHTWEIGHT.

Redrup Radial Engine as a Marketed Proposition under a New Name.

The 2¾ h.p. British Radial immediately strikes one as being a neatly-designed lightweight in spite of the unconventional position of several of the fitments.

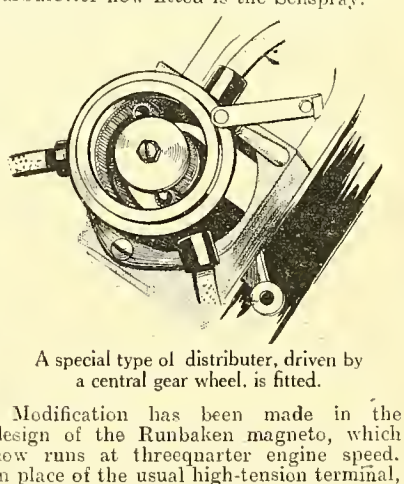
BUT for the difficulty of accommodating a four-cylinder engine in a motor cycle frame, there would be more machines of this type on the market, if only on account of its smooth torque effect and its excellent balance. These effects are obtained to a certain degree in a flat twin—hence its popularity.

The three-cylinder radial is a type which should offer possibilities as a step between the two, for it provides even firing and one more impulse every cycle of four strokes, *i.e.*, two revolutions.



In our issue for February 5th last year, we published details and illustrations of the 309 c.c. Redrup radial, which, incidentally, made its *début* in competitions in the A.C.U. Six Days Trial.

As announced in last week's issue, the manufacture of the Redrup has been taken over by the Radial Engine Co., Lacland Place, 429b, King's Road, Chelsea, London, S.W.10, who are producing quite a taking little mount, which we are now able to describe.



An Ingenious Timing Gear.

The three cylinders have detachable heads, are 50.8×50.8 mm. bore and stroke, and form a single casting with the crank case. Two crank case ends are screwed into the crank case shell, and these serve to support the bearings and also the eccentrics actuating the ingenious timing gear. The valves are reached by removing the cylinder heads; inlet and exhaust are on opposite sides of the cylinder, and the exhaust valves are so disposed that they are nearest to the draught set up by the vaned flywheel. Certain modifications have been made to the original design, the chief being the arrangement of the exhaust pipes, which now form a complete circle, thereby doing away with the acute bends in the original triangular exhaust pipe design. The oil sump and mechanical oil pumps have been eliminated; and the lubricant is now delivered to the engine through a Best and Lloyd drip-feed lubricator to a point in the crank case over one of the timing gears.

Another alteration is being made in the disposition of the carburetter, which will now take the position previously occupied by the magneto, while the magneto will be located behind the saddle tube of the frame. In its present position the carburetter is situated too near the ground, where it is liable to receive damage. The carburetter now fitted is the Senspray.

The flywheel side of the 2¾ h.p. British Radial. Note the cowl or rim surrounding the flywheel, also the shield under the engine

A special type of distributer, driven by a central gear wheel, is fitted.

Modification has been made in the design of the Runbaken magneto, which now runs at threequarter engine speed. In place of the usual high-tension terminal, a flanged steel gear wheel is fitted as an extension of the shaft. Surrounding the wheel is an internally toothed fibre case in which there are three equidistant brass segments, and between the case and the wheel there run two toothed steel rollers, which distribute the current at correct intervals.

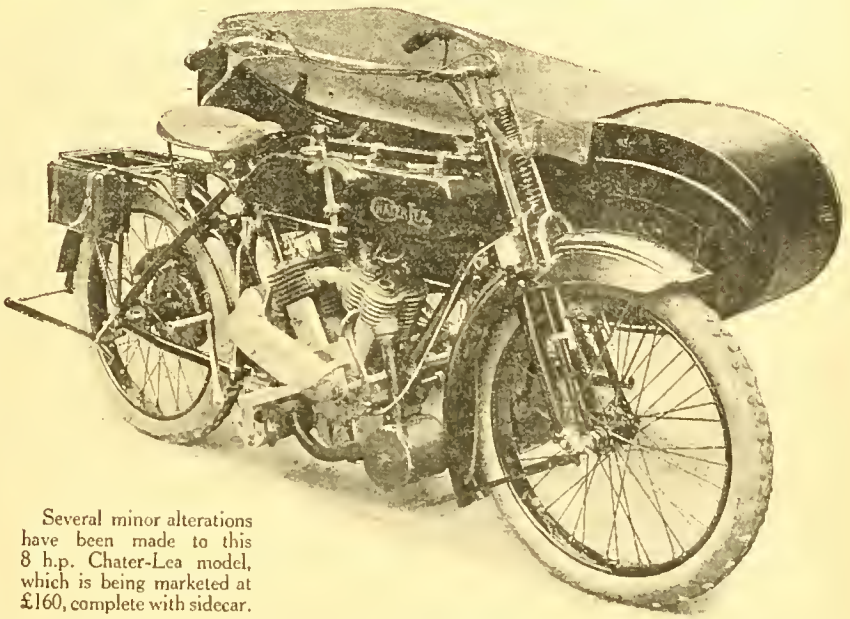
Both Brakes on Rear Wheel.

Constructed chiefly of Chater-Lea parts, the frame has a sloping top tube, Chater-Lea forks, and two band brakes on the rear wheel, one operated by hand and the other by pedal. In general appearance the machine is distinctly attractive. Comfortable footboards are fitted, and the polished aluminium cowl surrounding the flywheel is designed to direct a blast of air on to the engine.

Points of convenience have been well studied, the mudguards are valanced, and the machine is thoroughly equipped. There is a shield under the engine, while the gear box is the Sturmey-Archer two-speed, incorporating clutch and kick-starter.

On the road we found the engine to have ample power and to run extraordinarily smoothly, and we are looking forward to a more extended trial. Incidentally, a member of *The Motor Cycle* staff has had one of the original Redrup engines in use for some time.

FUTURE MOTOR LEGISLATION.



THROUGHOUT the latter part of last year motorists were repeatedly buoyed up with semi-official statements to the effect that early in 1921 a new Motor Car Bill would be introduced in the House of Commons. This measure was to codify and bring up to date the various regulations that have been hung to the Motor Car Act of 1903, and the automobile community at large was (says *The Autocar*) looking forward with considerable eagerness to the appearance of a Bill which would, for the first time, do away with anachronisms and generally eliminate absurdities. One of the most important points to be dealt with in the new Bill was the maximum speed at which motor vehicles of all kinds might be driven. A Government Committee has within the past few weeks been taking evidence on the subject, and while there seems to be a possibility that in the case of private motor vehicles all speed limits will be abolished, in which event the authorities would rely upon a clause prohibiting the driving of cars to the danger of the public, we are still of opinion that, even if such a recommendation be made to the Minister of Transport, and inserted in a Bill, it will not receive the sanction of the House of Commons. It seems to us far more likely that the Bill will embody clauses in which the speed limits now in force for the various types of motor vehicles will be considerably increased. Perhaps the maximum speed permissible for private cars and motor cycles will be raised from 20 to 30 m.p.h., and for heavy commercial vehicles running on rubber tyres from 12 to 16 or 18 m.p.h.

A Moderately Priced Big Twin Sidecar.

Elimination of Non-essentials is the Keynote of the No. 10 8 h.p. Chater-Lea Outfit.

IN motor cycle circles the name Chater-Lea has always indicated high quality in material and finish, and the new No. 10 sidecar outfit will naturally uphold the excellent traditions of the firm. It has been produced in response to a demand for a high-grade outfit complete with all the features necessary for serious touring, but sold at a moderate price.

The new model is fitted with a Chater-Lea 50° V twin engine of 964 c.c. (85 × 85 mm.) with silent valve mechanism, adjustable tappets, interchangeable valves, and large diameter bearings. It also has a three-speed car type gear box bolted to a rigid hanger, giving perfect alignment. The shafts run in large ball bearings, while the Chater-Lea ball bearing metal-to-metal multiple disc clutch, which has 130 sq. in. of contact surface, is retained. It is fitted to the engine-shaft, and thus runs at engine speed.

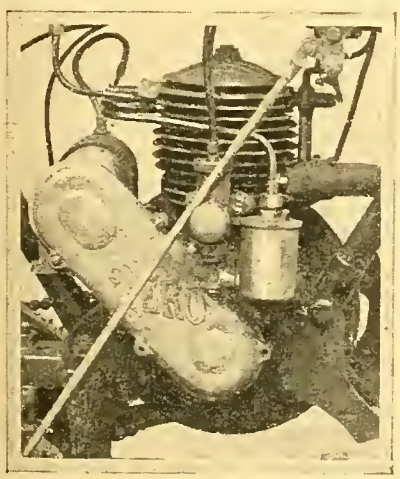
Several minor alterations have been made to this 8 h.p. Chater-Lea model, which is being marketed at £160, complete with sidecar.

Detachable but not Interchangeable.

The rear wheel is of the quickly detachable Chater-Lea pattern, while the front wheel can be removed by means of the knock-out spindle (they are not interchangeable); 700 × 80 mm. Dunlop heavy tyres are fitted on flat base rims.

An internal expanding rear brake is located in the hub, the drum being combined with the chain ring. It is 7in. in diameter, and has segments 1¼in. wide.

The tank holds over two gallons of petrol and two quarts of oil, and has a semi-automatic lubricator. The front, back, and sidecar mudguards are specially stayed, and, fitted independently of the hub axles, are of ample section, and allow plenty of clearance.



The sidecar embodies the Chater-Lea girder design of chassis, and is of great strength, while the body is well upholstered and comfortable.

Including the usual tools and accessories, this outfit sells at £160.

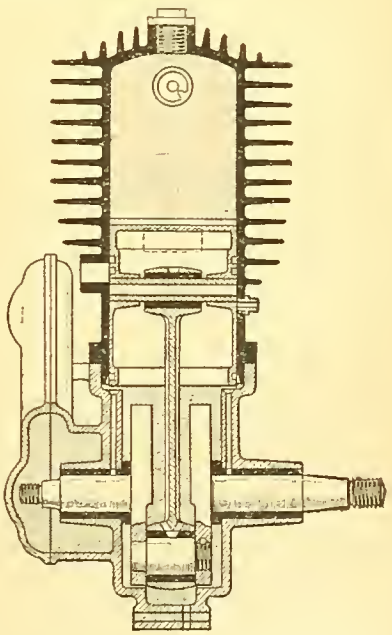
A New Two-stroke Engine.

Very Sturdy Construction is a Feature of the 2½ h.p. Pero Power Unit.

DESPITE the remarkable vogue of the two-stroke motor cycle, there are not so many *different makes* of two-stroke engines on the market as one might imagine. Therefore, a new design, even although mainly following conventional lines, is not without interest.

Neat lines and evidences of durability are features of the new Pero two-stroke engine

Simplicity and durability are the main aims of the Pero engine, and, as the cross section shows, all the bearings are on very ample lines. Plain phosphor bronze bushes are used throughout. Lubrication, controlled by a Best and Lloyd drip-feed, sends oil straight to the cylinder wall; thence it runs into a well in the top of the crank case. It is now led down two oilways to the main crankshaft bearings; the remaining parts are lubricated by splash.



A two-piece crankshaft, with no loose balance weights, and very deep radiating fins, are other minor but yet important points.

Carried on an aluminium platform, which is cast integrally with the magneto chain cover, the magneto it·'s is placed in a protected position behind the engine. Following the best modern practice, the release valve gases are led by a neat passage to the main exhaust pipe.

The overall dimensions of the Pero engine are less than the average of similarly sized (70×70 mm.=269 c.c.) power units; the weight, too, is only 34 lb.

In order better to judge the capabilities of this new engine, we carried out a fairly extended test on the road. Remarkable power and flexibility proved to be its chief virtues; petrol consumption was not at all excessive.

The makers are the Pero Works Co., 23, Potter Street, Birmingham.

Cross section, showing very large plain bearings and the built up crankshaft.

SECOND-HAND PRICES.

How to Find at a Glance an Approximate Value for any Motor Cycle.

In "The Motor Cycle" for March 3rd we printed a very ingenious formula, proposed by a reader (Mr. Frank Hall, of Stockton-on-Tees), for determining the value of a second-hand machine. This formula aroused considerable interest, but met with the inevitable complaint that, to use it, one must possess a fair knowledge of mathematics. To overcome this, "C.F." has devised the accompanying chart, which is based on Mr Hall's formula, and which may be used without the help of either higher mathematics or of a slide-rule.

NO one will deny the ingenuity of Mr. Frank Hall in attempting to solve by means of a formula the difficult problem of ascertaining the approximate value of a second-hand motor cycle. It is not, however, to be taken for granted that every owner or prospective buyer of a second-hand machine is a good enough mathematician to be able to perform the simple operation of raising 0.9 to 5.5 power.

To those then to whom such an operation is a mystery, the accompanying chart will be useful, or at least interesting. Indeed, so simple is the working of the chart that there seems to be no reason why Mr. Hall's formula, when reproduced in this form, should not become of universal utility.

The three curves Nos. 1, 2, and 3 for the different months of the year are plotted from Mr. Hall's formula

$$V = \left\{ \frac{(y-1)^n}{y^n} \right\}$$

To many it will seem to give too high a figure for the second-hand machine, but it may be assumed that the values given by these three curves are for a machine which is in good condition considering its age. This, unfortunately, is very seldom met with in machines which have changed hands once or twice, and the older the machine the more likely is it that it has received more inconsiderate treatment.

No. 4 curve has therefore been plotted from the formula $V = x \cdot 0.86^n$, which has been adopted as giving a fair average value of second-hand machines of this latter class: that is, of machines which are still in good running order but have not been kept in first-class condition. It is to be feared that this class is lamentably large. The method of using the chart is as follows:

From the bottom left-hand corner A of the chart draw a line to the stroke on scale B denoting the present-day price of the machine, sidecar, etc., as explained by Mr. Hall for the use of his formula.

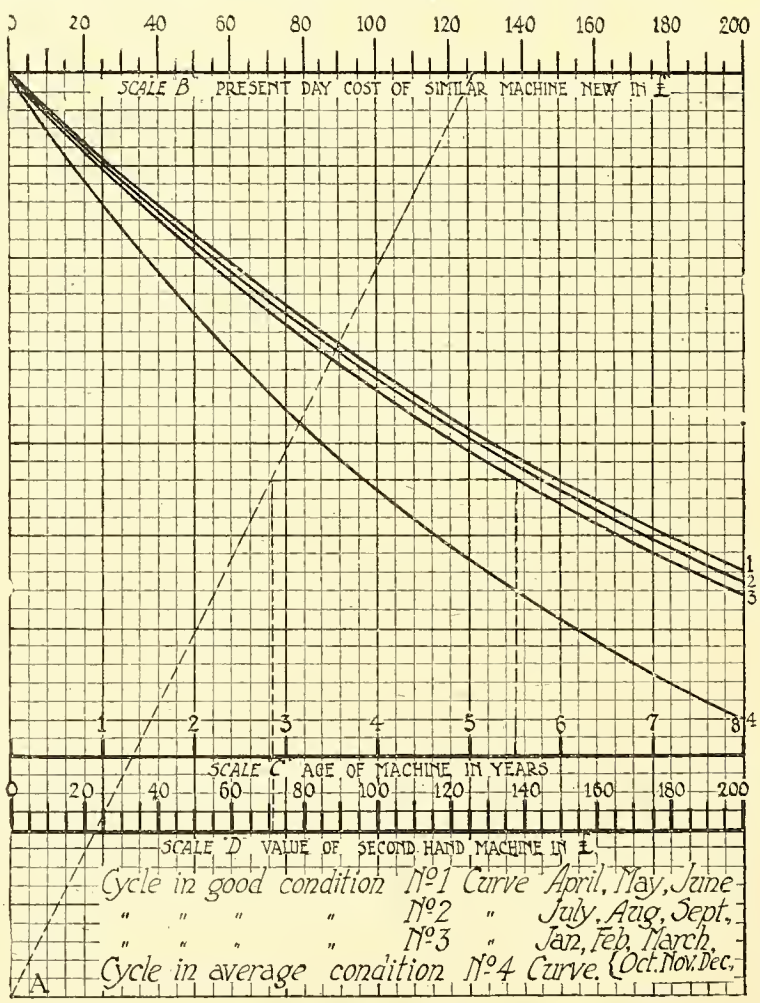


Chart for finding approximate values of second-hand machines.

From the stroke on scale C denoting the age of the machine in question draw a vertical line to whichever curve corresponds to the prevailing conditions (that is, if the machine is in first-class condition, and the month in which the purchase is being made is August, No. 2 curve is used; if the month is May, No. 1 curve is used; and if the month is December, No. 3 curve is used. On the other hand, if the machine is not in first-class condition, a fair average value is obtained by using No. 4 curve).

From the point where this line cuts the curve to be used draw a horizontal line to cut the line first drawn from the mark A to scale B, and from the intersection of these two lines draw a vertical line to scale D at the bottom of the chart. The reading on this scale gives at a glance the value of the machine in pounds sterling.

This chart can be used for exactly the same purposes as the formula—in fact, it is but a graphical method of working out the formula, the method of arriving at the result being the same as that described by Mr. Hall.

The dotted lines on the chart show graphically the example given by Mr. Hall as No. 1. C.F.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

AN ANOMALY IN GEARS.

Sir,—I am surprised to see that the great majority of makers are continuing to fit two-speed clutch gears to lightweights. A cheap, simple dog two-speed is in order, but when a clutch and kick starter are included, why on earth not three speeds instead of two, or better still, four speeds? The additional weight would only be a very few pounds, and would completely alter the capabilities of the machine. New manufacturers would hardly dream of making a "3½" with only two speeds, yet the poor little 2½ h.p. lightweight has to jog along on two. I think most purchasers would be prepared to pay a pound or two extra for the third ratio.

G. T. NEWBOULD.

CHAIN LUBRICATION.

Sir,—Though I cannot claim to have tried Mr. Henry Evans's tip (in your issue of April 7th) for keeping a naked chain clean, it seems that the oily paint brush would collect the mud and grit off the chain, and some of it would adhere. Thus I should think that no advantage is gained, for there would be a continual "sand-papering" effect produced by this grit-laden brush. In fact, it would be better, in my opinion, to let it alone. H.S.P.

Osborne.

Sir,—After reading the many various tips *re* naked driving chains, I cannot refrain from sending you mine, in the hope that it may prove useful to other readers. Mix fine powdered graphite with any stiff gear grease to form a stiff paste, mostly graphite. Apply with a paste brush. After ten miles the grease will have gone and the rollers have an oxidised look, which I find remains on for at least 150 miles, and sometimes more. I have used this method for a long time, and find it cheaper and better than any other patent product I have tried. I get a very long life from my back chains, which I put down to my treatment.

Gosport. J.B.M.

QUEER BEHAVIOUR OF A TYRE.

Sir,—Can any of your readers offer a solution of the following? Starting in the morning with tyres hard, the back wheel commenced to bump on the rim after covering about a mile. I pumped up in hopes of being able to return to the garage for repairs, which I accomplished and found tyre still board hard.

After half an hour's wait without further signs of leakage, I decided to resume the journey, and after a couple of hours running about town, the tyre was still O.K.

I then went for a spin, and on clearing the tram lines, opened up, when the tyre instantly deflated. On removing the tube I could find no trace of a leak, even with the greatest care. I refitted the tyre and pumped up and ran machine for about two and a half hours fairly slowly, being in a lazy humour. But, on again opening up to approximately 25 m.p.h., the air in the tube immediately disappeared without the usual unpleasant hiss. On applying the inflator I found that the tube refused to hold even the slightest trace of air. Again removing the tyre I found no leak, and, refitting it, was able to pump up as usual after travelling another three or four miles further, and this performance was repeated, identically, when I managed to reach home.

As further information, the tube is in perfect condition. The few patches on it are all secure. The valve and its seating are both all right. C.P.V.T.

Dublin.

THE PERSONAL ELEMENT IN TRIALS.

Sir,—Mr. Basil Anderson has brought up a question which is often asked, and the reply generally infers that the machine sold to the average man will not do what machines ridden by trials riders will do, and that the latter machines are all special models.

Now regarding reliability trials riding, with a very few exceptions this opinion is entirely wrong. The real trouble is that the average man who owns a motor cycle does not keep his machine in good tune, is a bad or inefficient driver, or will not compete in competitions for fear of damaging his machine or knocking it about. And, lastly, there is the man who either thinks competitions are too strenuous, or to whom they do not appeal.

Regarding Mr. Anderson's remarks in his last paragraph, namely, "Should any manufacturer be bold enough to allow and advertise the fact that his machines were to be ridden by men culled from the ranks of ordinary motor cyclists . . . the public would take a greater interest. . . ." I am afraid it would be of very little value either to the manufacturer or the public, because most of the failures would be caused through bad handling of the machines, owing to this class of rider not being used to negotiating such difficult pieces of country as are necessarily put in to make up a trial course. The personal element only comes in to show that if the machine is handled properly it is capable of doing the work required of it.

If Mr. Anderson were buying a piano, and he heard me make a noise on it with one finger, and then heard a musician play on a similar instrument, would not the musician's performance be the deciding factor? It is the trials rider who shows the public what the modern motor cycle will do if handled properly, and so makes it more perfect and better for those who are not so expert.

Perhaps Mr. Anderson has not yet heard that an amateur won the Colmore Cup, and, I think I am correct in saying, not on a special machine. R. W. DUKE.

Another squad of Belgian motor cycle police. In this case their mounts are Triumphs, all two-strokes, except in the case of the sergeant, who chooses to ride a 4 h.p. model.

A PRIVATE THIEF-PROOF DEVICE.

Sir,—I notice in a recent issue details of an ingenious petrol tap lock, and this makes me wonder whether the users of certain variable jet carburetters are aware that they can make their machines more or less thief-proof in one second by simply turning the adjusting screw sufficiently to close the jet orifice. So long as the screw is marked it can be turned on again, just as quickly, to the usual setting. I have always followed this practice with such carburetters as the Schebler, B.S.A., etc., and also with the W.R.S. new attachment. It is advisable, however, not to forget what has been done when one wishes to resume the journey. I recently nearly broke the kick-starter and also my own starting mechanism in vigorous attempts to start my machine, all of which were ineffectual until a brain wave made me recollect my thief-proof (but evidently not foolproof) gadget.

ERNEST McCREA.

A.A. PATROLS AND BREAKDOWNS

Sir,—With regard to the A.A.'s demand for increased subscriptions, I should like to state my experience of a recent Sunday. I was riding a borrowed machine along the London Road from Rugby to Coventry, when the back tyre burst. As there was no repair outfit in the tool bag I pushed the machine two miles back to the A.A. filling station on Blue Boar Corner, expecting to find any aid I required on production of my membership card, but was amazed to find the patrol had no repair outfit or tools other than his own private cycle kit. The place was not even on the telephone and I had to push the machine the remaining three and three-quarter miles into Rugby. I have been a member of the A.A. for some time, but this was the first occasion on which I have needed its service; and until this sort of thing is remedied and some serious attempt made to give members something more than a brass badge and a guide book (which contains one or two inaccuracies) in exchange for their subscription it certainly will not get any more money from me. I remain (until March 31st),

Rugby. ANOTHER UNGRATEFUL MEMBER.

WHY OBJECT TO MUD?

Sir,—It would be interesting to know why so many people are clamouring for better mudguarding on motor cycles, and leaving the question of hoods entirely on one side. Surely so long as one is content to be drenched every time one goes for a run and it comes on to rain, one should not mind a little mud on one's overalls; and, as a hood is obviously both undesirable and impossible, why grouse about mudguards? Let those riders who object to the discomforts of motor cycling purchase a scooter, and for ever after hold their peace! A motor cycle is *not* a car on two wheels, and never will be—it is not designed or intended as such. To my mind, a motor cycle is represented by a machine faster and handier than a car, more economical to run, and easier to look after, but having a certain amount of discomfort attached to it.

My ideal is almost realised in the machine I own at present. The machine to which I refer is a 1920 3½ h.p. three-speed Norton with B.R.S. engine, Binks carburetter, and Lucas Magdyno, also a Brooks B225 saddle.

It is very fast, very economical—I average over 100 m.p.g. on half benzole and petrol in a very hilly district—develops really extraordinary power, and is exceedingly easy and pleasant to handle under any conditions: a very great point, to my mind. It is the essence of simplicity, and any adjustment can be made with the minimum of trouble. For instance, when decarbonising, the cylinder will *really* come off, and will not stick halfway. The tick over, hot or cold, is wonderful, starting is easy, and acceleration and power all that can be desired. I do a great deal of hard riding, often with a heavy passenger on the carrier (*not* the "one and only"), and a twenty miles run almost every night. The Magdyno has always worked perfectly, and gives a splendid light and a first-rate spark at high or low speeds. The riding position is comfortable, and gives extreme steadiness in grease, and all the controls are in a natural position. *But*—one certainly does get muddy! I admit, however, that I do not mind very much, for, after all, almost every form of sport has its unpleasant side—in fact, it would cease to be a sport if it had not.

May I conclude by saying I have no connection whatever with Nortons nor with any of the other firms mentioned?

Cockermouth. UNAPPROACHABLE

PRICES IN INDIA.

Sir,—Being particularly interested in Indian business, perhaps a few words of enlightenment would be of service in dealing with the question of prices charged by agents for machines in the various parts of India.

Your correspondent from Allahabad (*vide* page 887 of your issue dated December 30th, 1920) points out that a B.S.A. outfit, Model K, is being advertised for Rs. 2,150. He maintains that this figure is extortionate, but before one can arrive at such a decision it would be wise to take into consideration the rate of exchange ruling at the time this machine was received in India, as all agents in that country cannot sell at present at a fixed figure.

The rate of exchange for the past twelve months or so has fluctuated from 2s. 9d. down to 1s. 4d. per rupee, and, taking a B.S.A. machine at the rates your correspondent names, viz., £150 for the outfit, plus £10 for duty, plus £15 for importation costs, a sum total of £175 sterling is made. Basing this sterling price on both the highest and lowest rate of exchange, you get the following actual cost delivered in India: Rs. 1,273 and Rs. 2,625.

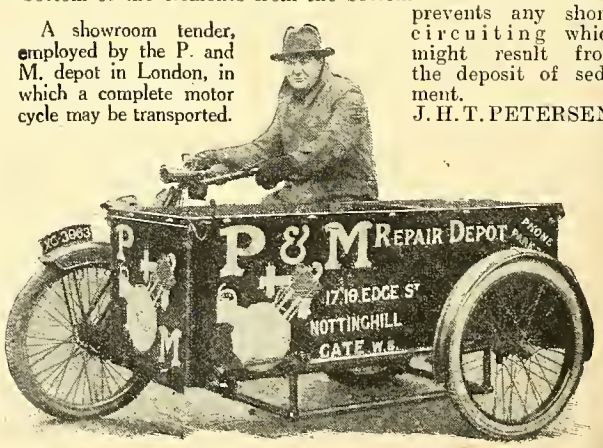
I trust that you will be able to find room in your journal for these few remarks, as no doubt many purchasers overlook this fact. Moreover, the majority of manufacturers in this country are not aware that the fluctuation of exchange prevents their agents from selling machines at a fixed price year in and year out.

E.W.G.

Palmers Green, N.

Sir,—With reference to Mr. Mukerji's letter, which you quote under heading of "Comparative Prices" on page 877 of your issue of December 30th, this is most misleading. Your correspondent has taken the rate of exchange as 1 rupee equals 2s. It is quite some time since the rupee was worth this. Current rate is 1s. 4½d. Mr. Mukerji allows the agent £175 for catalogue price and duty and importing charges, which, at the above rate of exchange, works out at about Rs. 2,500. Anyone who has lived in India during the war knows that, owing to Government restrictions, no British cars could be imported, and the Americans therefore had a clear field.

F. H. HAWKINS.



(TWENTY-ONE YEARS IN INDIA.)

SHORTING AN ERITH BATTERY.

Sir,—With reference to your correspondent "T.D.L.'s" letter in a recent issue of *The Motor Cycle*, re accumulators for motor cycle lighting, we note that he remarks that with the round plate type manufactured by the Erith Battery Co., Ltd., a dead short does not appear to harm it in the least.

As sole selling agents for these accumulators we would, however, like to warn users of these that, although this type will withstand such treatment to a very great degree, it is not a practice which should be adopted, as even this type will in time deteriorate if persistently ill-treated in this manner. The fact that these accumulators will withstand dropping is due not only to strength in construction of the elements, but to the fact that the whole of the elements are insulated from shock from the celluloid case by patent rubber buffers at top, bottom, and sides to ensure a long life under all conditions of vibration. The base buffer, moreover, since it raises the bottom of the elements from the bottom of the celluloid case, prevents any short-circuiting which might result from the deposit of sediment.

J. H. T. PETERSEN.

A showroom tender, employed by the P. and M. depot in London, in which a complete motor cycle may be transported.

TANDEM OR TWO-SEATER MOTOR BICYCLES.

Sir,—I consider there is a decided opening for a two-seater motor bicycle, and I quite expected to see one on the market this year. It need not be a long ugly thing, as the length need only be 12in. to 14in. longer than the single-seater, and the extra length should be an advantage both for the springing and the transmission. It would make a very economical two-seater, as half the motor cyclists of to-day have not the convenience for keeping a sidecar; and to keep a sidecar away from home means, perhaps, another £12 per year. One would be far more likely to go for a run on a dull day if one could take a friend with one, comfortably seated on the cycle. Take a week-end run, for instance; the pleasure is doubled if one has company.

RAYMOND C. HOWES.

SPEEDS ON KOP HILL.

Sir,—Might I raise a point with regard to the last Essex M.C. hill-climb at Kop Hill on April 2nd?

The fastest time of the day was given as 30.4s., and several others as 32s. and upwards. The nature of the hill should be considered—it is not a Porlock, but nevertheless it is rough, several gulleys running across it, two slight bends, a fairly steep gradient, and a final gradient of 1 in 5½. Now the distance covered was given as nearly threequarters of a mile, and is it not a little astonishing that this was covered in 30.4s. (and upwards), thus giving us a speed of about eighty miles an hour, and also for the competitors, motor cycle and car, to cover this distance in such short times? I think that the distance covered must have been nearer a half or five-eighths of a mile to be accomplished in such short times.

I might say that I know the hill well, but was unable to attend on the day. I do not wish to discredit the competitor, machine, or the Essex M.C., but I think that the distance covered in the times given must set a few readers of *The Motor Cycle* thinking and wondering if both times and distance are correct.

W. BEDGGOOD.

[The measured course on Kop Hill used by the Essex M.C. was 41 chains in length (902 yards, or .513 mile); therefore de la Hay's speed was approximately 60.7 m.p.h. The total length of the hill is 58 chains (1,276 yards, or .725 mile). It was not stated in *The Motor Cycle* that the climb measured nearly threequarters of a mile.—ED.]

WHERE ARE THE SCOOTERS?

Sir,—In a recent issue "Ixion" asks, "Where are the Scooters?" Well, personally, I am glad to say that one of them is still in my possession, and I should be very sorry indeed to be without it. I have had it now a little over a year and done about two thousand miles on it, and it is running better than ever. Of course I do not for a moment pretend that a scooter can compete with a motor cycle, but if you live in a hilly country, as I do, and a few miles from the nearest town, and get a good scooter, simply to take the place of a bicycle—then I have no doubt that you will find it, as I do, a joy and a comfort. As for those wonderful tales about scooters I have a suspicion that "Ixion" manufactured them to amuse his readers, but if this is not so, then all I can say is that, either they must have been very bad scooters, or else very incompetent owners. My machine will do over twenty miles an hour, but as I only care to go at a cycling pace I ride at ten to fifteen, and at that pace I climb all the hills about here—and this, as I have said before, is a hilly country. Last summer, after tea I used to go for little two-hour joy rides of twenty to twenty-five miles, and very pleasant they were. At the present moment, while I am away from home, my little Skootamota is being repainted and overhauled, for I think it has well earned this. So that looking back on my past year and realising how admirably my machine has fulfilled my needs, I think I may say on my part that these strictures leave my withers quite unwrung.

E.F.

Tunbridge Wells.

ALL-WEATHER RIDING.

Sir,—A doctor must ride in all weathers and still appear presentable. His coverings must be easily removed.

I find the legs are best protected by Brooks "leggings," and I cannot speak too highly of their value. I use the long pattern for rainy days and the short pattern otherwise. The strap under the instep should be cut away, as it is not essential, and the long leggings can then be put on in eight seconds. The short leggings take less time.

These leggings are efficient in the wettest weather, though snow is sometimes blown under the flap covering the foot.

In heavy rain water is apt to collect in one's lap and run through the join of the waterproof. To avoid this I use a stout waterproof sheet 1¾×3½ft., which is fixed to the forks above the tank by two small straps. A brass stud is incorporated in each strap. This stud pierces the waterproof, which is here reinforced by a disc of leather. The strap encircles a cross member of the forks, and the stud is then pushed through a slit in the strap. This fixes the sheet securely to the forks, and leaves the buckle and strap end free to fasten round the sheet when rolled up.

At the rear end of the sheet on the right-hand side is a stud or push-button, such as is used in gloves. On the left-hand side is a buckle and adjustable tape an inch broad, having the push-button cover at its end. This tape embraces one's back, and the "cover" is pushed on to the push-button with the right hand. This produces an apron effect, which is very efficient and instantly releasable.

Not the least important use of the apron is as a saddle cover. The tape then passes round the carrier to prevent the apron being blown off. The cycle may then stand in the heaviest rain without the saddle getting wet. When not required it is rolled forward and strapped up in a moment.

Two things I should like to know—how to prevent one's front mudguard becoming packed with snow, thus "braking" the wheel, and how to cross a stream without having to put one's foot into the water?

I use a two-year-old 3½ h.p. Sunbeam. It has never failed me since I inserted an Apollo mica-insulation plug, which has now been in use for 5,000 miles, and has never given any trouble.

I have no interest in the firms named other than as a satisfied user of their goods.

M.B.

Midlothian.

SUMMARY OF CORRESPONDENCE.

Two letters dealing with road courtesies have reached us. In one of these a reader (Mr. G. S. Applebee) revives the old suggestion that motor cyclists, resting by the roadside, should exhibit a white handkerchief sign to denote that they do not require help. Our second correspondent, who signs himself "Mechanician," suggests, among other things, that there should be special signs to denote, "You are running on the wrong side of the highway; get over to your own side!" and "I will report you to the A.C.U. (or A.A.)!"

Inspired by a recent letter headed "Under Difficulties," "Relic" sends a report of a 200 mile run on a 1908 3½ h.p. Rex, which he accomplished with only two stops *en route*. We are inclined to agree with him that such runs are more "sporting" than those made on brand new machines.

Mainly for the benefit of Surrey readers, Mr. R. Malcolm points out a danger spot not far from the main Wimbledon Common road. It lies at the junction of Calonne, Somerset, and Burghley roads.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*

	Price net.	Book post.
"HINTS AND TIPS FOR MOTOR CYCLISTS" Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A system for tracing motor cycle faults and of remedying them when found. Fourth Edition ..	2/-	2/3

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

A STANDARD TIMING.

I have an Arno motor cycle of 3½ h.p. or 4 h.p. It is fitted with a three-speed S.A. hub gear, and by its general design and appearance I conclude it is either a 1913 or 1914 model. I wish to convert this machine into the sporting single-geared type, so should be much obliged if you would furnish me with particulars of most suitable valve timing for general running.—F.L.H.

The engine is a 3½ h.p. model, and we recommend you to keep to the standard timing. Set the exhaust valve so that it is just closing and the inlet just commencing to open when the piston is on top dead centre of the stroke.

BALANCING.

Some months ago I purchased an out-of-date machine. It runs very well up to 20 m.p.h., but between that and 25 m.p.h. the handle-bars vibrate badly, so much so that the lamp-bracket has broken three times. I first made certain that the engine was secure in the frame. Finding it so, I dismantled the engine entirely. The previous owner, I presume, had lightened the engine, as I found the flywheels were drilled and weighted with lead, the connecting rod drilled, and the piston had only one ring and slot at the top. I have weighed everything on a pair of scales, and find that the weight of piston, including ring and gudgeon pin, is 1 lb. 10 oz., and the weight of connecting rod 1 lb. The weight that balances the bob-weights on flywheels is 1 lb. 12 oz., which includes the crank pin of 4 oz. I arrived at this by the following method: I disconnected the flywheels, and took out the connecting rod, and reassembled. I then made a pair of runners for the ends of the shafts to run on, and made a hook of wire to fit the crank pin by placing 1½ lb. on this hook. The flywheels balanced perfectly, so, the crank pin weighing 4 oz., I presume the balance weights on flywheels weigh 1 lb. 12 oz. Now, what I wish to know is, should I drill out some of the lead from the flywheels or from piston (which seems to be very soundly constructed)?—A.L.F.

Judging by the weights you give, the engine is slightly under-balanced, and we would suggest that you add from 1¼ to 2 oz. to the balance weights on the flywheels. Add an equal amount to each flywheel, and test the effect with the smaller quantity before adding more weight.

TWO-POINT IGNITION.

Shall I be liable to damage my magneto if I insulate the sparking plug from the engine, then run a wire to another plug in the exhaust cap, the current thus running through both plugs? It is my contention that with this arrangement no harm can take place if the current flows positively through the high-tension wire, as the second plug will be fired momentarily after the first, and not as if the gap were doubled.—A.G.

You will not damage the magneto provided that the combined gap of the two plugs is not more than ⅛in. You are wrong in your assumption that the spark occurs at the second plug. The sparks may be considered to take place simultaneously, and the resistance to the flow of current is the same as if one gap equal to the combined gaps were used.

LOW POWER AND TOP GEAR CLIMBING.

I have a 2 h.p. overhead valve Mead-Precision, and would like you to tell me what is a suitable gear ratio for hilly country. The engine-shaft has fifteen teeth geared into thirty teeth on camshaft geared into thirty teeth on driving-shaft for high gear; and eighteen teeth on camshaft geared into forty-two teeth on driving-shaft for low gear, with 4in. belt pulley and 14in. belt rim.—J.B.

The sizes of the pinions give a top gear of 7 to 1 and a low gear of 16.3 to 1. These gear ratios should be about right. Owing to the small capacity of the engine, you cannot expect a very good performance on high gear. You are perhaps unaware that the particular model which you have was only on the market for a short time before the makers increased the size of the engine.

WHERE CHAIN DRIVE SCORES.
G. H. Tucker (4 Norton sc.) navigates the watersplash between Rhayader and Devil's Bridge in the Western Centre Two Days Trial

MAKING A DYNAMO.

? I have a U.H. magneto which I intend to turn into a dynamo for lighting a motor cycle. The field magnets are 2in. wide, and the armature is 1¾in. diameter. What size wire and what ratio of gearing from the engine do you recommend for using the H armature that is already in the magneto to light six-volt lamps?—A.J.L.

You will have to find out the amount of wire by experiment. Use 22G double cotton-covered copper wire, and get as much on to the armature as you can. It is doubtful whether you will be able to light six-volt lamps; four-volt are more likely. Run the armature at about one and a half times the engine speed.

LOOSE FLYWHEEL.

? Since fitting a new 2¼ h.p. Levis cylinder, piston rings, gudgeon pin, and rebushing, I have run about 800 miles without trouble, until recently the big end came undone through the screw breaking. I finished my journey without mishap, except clatter, and was somewhat surprised to find no damage done, so far as I could see. However, upon putting things together again, although everything appears to be in order, it will only fire as though pre-igniting, or as if an explosion occurred in the crank case or downward stroke of the piston about every second revolution. It appears to hold the piston from descending, but, by going to the top of a steep pitch and "blinding" down, I managed once only to obtain correct firing for about two and a half miles at all speeds from six to thirty miles per hour, after which period pre-iguition again returned, which, of course, in every case resulted in the flywheel running loose. What is the cause?—F.E.

We should imagine that the whole trouble is due to the flywheel being insecure upon the mainshaft, and would strongly recommend you to return the engine to the makers for attention, as it is doubtful whether you will be able to rectify it yourself.

TWO-STROKE HINTS.

? (1.) I have a 2½ h.p. Royal Ruby (Villiers engine) with Amac carburetter and C.A.V. magneto, which sparks well, but the engine is occasionally subject to a popping back through the carburetter, which is thoroughly clean. I have tried careful adjustments of the air lever, but have failed to remedy this nuisance. (2.) What is the capacity of the engine? (3.) How often should the engine be taken down? (4.) How many revolutions does the engine run per minute?—W.D.

(1.) The blow-back through the carburetter is probably caused by the fuel supply being slightly starved. Either the jet is too small or there is some restriction of the flow of petrol either between the tank and the carburetter or between the float chamber and the jet. (2.) The cubic capacity of this engine is 269 c.c. (3.) The cylinder and piston should be decarbonised about every 1,000 miles. (4.) The normal speed of this engine is about 1,500 to 1,800 r.p.m., but the actual rate of revolution, of course, depends on the road speed and gear.

READER'S REPLY.

BELT SLIP.

The following may be of assistance to "W.W.," whose query you publish in the issue of April 7th. My first motor cycle was a well-known 2 h.p. lightweight with a ⅝in. belt. I had much trouble with belt slip in wet weather, but obtained relief by the simple expedient of drilling a row of holes (I think 1/16in. diameter) in the flange of the pulley, care being taken that the holes were drilled in the track of the belt. Further, I rubbed the belt with a sticky compound called Belticum.—L.W.C.

EXPERIENCES WANTED.

"E.S.E." (Sheffield).—Use of Spots on 2¾ h.p. J.A.P. engine; also average consumption with Amac or other carburetter.

"L.S.L." (Brondesbury).—Beardmore-Precision motor cycles.

RECOMMENDED ROUTE.

REDHILL TO PINNER.—C.E.R.

Redhill, Reigate, Burgh Heath, Ewell, Surbiton, Kingston-on-Thames, Richmond, Kew Bridge Station, Gunnersbury Lane, Ealing Common, Hanger Lane, Alperton Station, Harrow-on-the-Hill, Pinner. Approximately 33 miles.

Important Dates.

Sat., April 23rd—Midland Centre A.C.U Open Reliability Trial.

Wed., April 27th—A.C.U. One-day Trial

Fri., April 29th and Sat., April 30th—Ealing and District M.C.C London-Holyhead Open Reliability Trial.

Sat., April 30th—Newcastle and District M.C. Travers Challenge Trophy Open Reliability Trial

Sat., April 30th—Surbiton and District M.C.C Open Inter-Team Trial (Private Owners only).

Sat. May 7th—B.M.C.R.C. Open Meeting at Brooklands.

Fri., May 13th, and Sat., May 14th—M.C.C. London-Edinburgh Run.

Sat. May 21st—Western Centre A.C.U. Open Hill Climb.

Wed., May 25th—A.C.U. Silencer Trial at Brooklands.

Sat., May 28th—East Midland Centre A.C.U. Open Hill Climb.

Tues., June 14th—Junior T.T. Race

Thurs. June 16th—Senior T.T. Race.

Sat., June 25th—M.C.C Inter-team Trial for "The Motor Cycle" Cup

Sat., July 2nd—Bournemouth M.C.C. Open Reliability Trial.

Sat., July 2nd—North-Western Centre A.C.U. Open Speed Trials.

Wed., July 6th, and Thurs., July 7th—Arbuthnot Trophy Trial.

Thurs., July 7th—Essex County and Southend A.C. and Essex M.C. Joint Open Speed Trials.

Sat., July 9th—St. Andrews Speed Trials

Mon., July 11th, to Sat., July 16th—Scottish Six Days' Trial.

Sat., July 16th—Yorkshire Centre A.C.U. Open Reliability Trial.

Sat., July 23rd—East Midland Centre A.C.U. Open Speed Trials.

Sun., July 24th—Motor Cycle Grand Prix Race in France.

Mon., Aug. 1st, to Sat., Aug. 6th—International Six Days Trial in Switzerland

Mon., Aug. 29th, to Sat., Sept. 3rd—A.C.U. Six Days Trial.

Sat., Sept. 17th—Grand Prix Race for Cycle Cars.

SPARKLETS

An Amended Award.

George Brough, who rode an 8 h.p. Brough Superior and sidecar in the Colmore Cup Trial, and was awarded a bronze medal, has now been informed by the committee that this award was due to an error; actually he gained full marks, and a high position in the acceleration test.

Ball Bearings.

In order to facilitate repair work generally, the Skefko Ball Bearing Co., Ltd., of Luton, has organised a special "garage supply department," so that small orders for replacement purposes can be filled immediately. Garage proprietors and repairmen should avail themselves of the special postcard order forms which the firm supply.

Catalogues Received.

Maplestone Cantilever Spring Forks, Ltd., Stirchley, Birmingham: A description of the Maplestone adjustable spring fork.

S. A. Newman, Ltd., 49-53, Lichfield Road, Birmingham: Ivy 2¼ h.p. and 3 h.p. models, also the 3 h.p. model K sidecar outfit, are described in the latest catalogue, which contains some details of the hill-climbing performances of these excellent little outfits. Two photographs of the Ivy sidecar climbing the Old Wyche at Malvern are reproduced from *The Motor Cycle*.

A.C.U. Publications.

"The A.C.U. Handbook and Touring Guide": A compact book containing a vast amount of information of use to motor cyclists. It tells the reader all about the Auto Cycle Union, it gives the rules in full, particulars of the affiliation scheme, the A.C.U. Consular service, and much information concerning touring, such as suggested tours and a map of a circular tour in England, Wales, and Scotland, a table of main road distances between important towns in England and Wales, and some hints concerning foreign touring. A large number of hotels and repairers now carry the A.C.U. sign, and a list of these is included in the book.

A legal section is of special interest at the present moment, as it tells the motor cyclist all about the new licensing, registration, and taxation regulations.

"The A.C.U. Handbook" is free to members, but non-members can obtain a copy, price 3s. 6d., from E. J. Burrows and Co., Ltd., Cheltenham.

"The Auto Cycle Union Competition Rules" (1s., the Auto Cycle Union, 83, Pall Mall, London, S.W.1): In this publication the A.C.U. open competition rules are published in their entirety. They have been drawn up with the idea of keeping the sport clean, and ensuring open competitions being carried out in a thoroughly regular manner.

Cycle Cars in the B.A.R.C. Whitsun Meeting.

One race at the B.A.R.C. meeting on Whit-Monday is open only to motor cars and cycle cars, the engine capacity of which does not exceed 1,100 c.c.

Ex-D.R.'s.

Ex-D.R.'s are now scattered over the four quarters of the world, and every mail brings letters from them. This week K. E. Tulloch, late of the 20th Signals, R.E., who writes from Hadeija Kano, N.P., West Africa, wishes to hear from old comrades of his corps.

Was it Ignorance?

According to *The Birmingham Mail* of April 11th, a Birmingham motor cyclist was summoned recently for "failing to have a rear-light sufficiently illuminated as to keep the identification plate easily distinguishable." No effort appears to have been made by the defence to point out that it is unnecessary to illuminate the rear number-plate, at all, on any motor cycle weighing less than 3 cwt., provided the front plate is distinguishable.

England v. Holland.

Considerable interest is being manifested in Holland in the forthcoming visit of the team of Dutch riders to compete against a representative team of British riders in England next August. During June the Dutch Motor Cycle Club will hold its Dutch Championship Trials, extending over four days, which are to serve as eliminating trials to determine the team to represent Holland in the International Trial.

The Belgian Grand Prix.

Among the many important Continental events this year there will be the Belgian Grand Prix, to be held on August 12th. It will be organised by the Belgian Motor Cyclists' Federation over a course approximately nine and a half miles long, triangular in shape, of which the three apices are Francorchamps, Malmedy, and Stavelot.

There will be two classes, the Senior (not exceeding 500 c.c.), which will have to cover the course twenty times; and the Junior (not exceeding 350 c.c.), which will have to cover the course fifteen times. The rules are very similar to those of the T.T. race, even to the 250 c.c. class being included, which will be eligible for special awards.

Entries at ordinary fees (500 francs) close on May 31st, and should be sent to Dr. Lamborelle, President of the Competitions Committee of the F.M.B., 14, Rue Charles-Martel, Brussels, Belgium.

Proposed Alteration of Date.

It has now been arranged to hold the North-western Centre A.C.U. open speed trials, fixed for July 2nd, at Morecambe; and the Centre is also endeavouring to alter the date to June 18th, and thus to attract returning T.T. competitors.

Yorkshire Centre A.C.U. One Day Trial.

"This trial is the best one day sporting trial ever . . . " is how the Yorkshire Centre event, to be held on May 7th by the Sheffield and Hallamshire M.C. and L.C.C., is described in a footnote on the regulations. Entries must reach the hon. trials secretary, Mr. A. Handford, 646, Abbeydale Road, Sheffield, before Saturday, April 30th.

Special Features.

A HOLIDAY WEEK-END.

SECOND-HAND VALUES AT A GLANCE.

T.T. NOTES AND NEWS.

Fastest Time on Kop Hill.

Most famous hills have their records. The fastest time ever made on Kop Hill is T. C. de la Hay's 30⅖s. on his Sunbeam. The previous best was L. P. Openshaw (Zenith), 32⅗s.

Silence.

If the authorities are really anxious to reduce traffic noises—and it would appear to be so since they are constantly worrying motor cyclists concerning their silencers—they might turn their attention to London electric trams, which are deafening in certain districts.

Scottish Open Hill-climb.

There are no fewer than twenty-two classes in the open hill-climb to be held by the Glasgow Western M.C.C. on Saturday, April 30th, on Garshake Hill, Dumbartonshire. Entries, which must be sent to Mr. J. R. Bell, 240, Great Western Road, Glasgow, close definitely on the 26th inst.

Modern Prices.

Triumph prices are down, the chain drive 4 h.p. model now being £125, and the chain-cum-belt £115. The lightweight is £70. The price of the 6 h.p. B.S.A. is £133 solo, £175 sidecar. The Royal Ruby sports 2¾ h.p. model has been reduced from 85 to 80 gns., and the 8 h.p. spring frame outfit from £235 to £220.

Playing to the Gallery.

In many cases, where fast machines are entered in reliability trials, there appears to be a tendency for the drivers to risk their non-stop performances by attempting spectacular ascents of difficult hills. This practice, while demonstrating the rider's personal adroitness, may easily cause a quite erroneous impression of a machine's reliability if a skid results in a stop. It is a practice not conducive to good propaganda for the whole movement.

They Get Things Done.

South African motor cyclists must be very like those in Great Britain. According to a South African journal, *The Motor Weekly*, "There are no keener or more enthusiastic motorists in South Africa than motor cyclists. They are probably a larger body than even car owners; from the social, sporting, and club standpoint they are certainly more active. They get things done. They are motorists for the love of it, and they are as devoted to their machines as the coster is to his donkey. They are the very soul of motoring in South Africa, as they are in most countries."

Comparative Motor Cycle Performances.

A Paper read before the I.A.E. on a Subject of Interest to all Motor Cyclists.

IT is not uncommon to hear extravagant claims made with regard to speed performances on the road. At these the engineer smiles, but many of the non-technical are deceived. Consequently, the paper on "Comparative Motor Cycle Performances" read by Mr. D. S. Heather, B.Sc., A.M.I.A.E., before the Institution of Automobile Engineers is of particular interest. The paper, which was delivered at Glasgow on Monday, will be repeated at Birmingham on the 28th, when an interesting discussion should take place. Below we give extracts from the most important parts of this interesting work:

The subject necessarily divides itself to three main sections: Tractive Resistance, Engine Performance, and Road Performance. These three sections are dealt with in the paper in the order named.

Tractive Resistance.

It has been shown by Wimperis and others that the resistance to motion of a vehicle at varying speeds may be expressed with quite reasonable accuracy by the formula:

$$Tr = A + Bv^2$$

where Tr = resistance to motion (tractive resistance)

v = speed of vehicle.

A and B are constants depending on the particular vehicle and road.

This formula is not strictly true, since it is likely that there are certain resistances which vary directly as the speed of the vehicle, so that $Tr = A + Cv + Bv^2$. Experimental data, however, show that the Cv factor has so small a constant as to be negligible. Unfortunately, it is not possible to determine the constants analytically, by reason of their complex character. An analytical determination being impossible, the only possible method is to proceed experimentally.

In a paper read before the Institution in 1914,* Mr. Wimperis gave particulars of the method which he adopted. This consisted essentially in allowing the vehicle to decelerate with the clutch disengaged, measurements of the deceleration being made at intervals, by means of an accelerometer, as the car slowed down. These figures are then plotted on a velocity base, the resultant curve being, of course, a deceleration-velocity curve. The weight of the vehicle being known, and a suitable allowance being made for the inertia of the rotating parts, such as the road wheels, it is only necessary to alter the scale of ordinates to convert this deceleration-velocity curve into a resistance-velocity curve.

For example, suppose that the car to be tested weighed 1,900 lb. complete, and that the equivalent weight of the rotating parts was 100 lb., so that the total weight for deceleration purposes could be taken as 2,000 lb., and that testing in the manner described above gave the following decelerations at the noted speeds, as plotted in fig. 1:

*See Proc. I.A.E., Vol. VIII., p. 281.

M.P.H.	Deceleration, ft. per sec. per sec.
10	0.82
15	0.91
20	1.11
25	1.33
30	1.60
35	1.91
40	2.27

Now it is evident that the deceleration at any particular speed bears the same ratio to the acceleration due to gravity that the decelerating force bears to the total weight of the car, so that, at 20 m.p.h., for instance, the tractive resistance

$$Tr = \frac{\text{deceleration}}{g} \times 2{,}000 = \frac{1.11 \times 2{,}000}{32.2} = 69 \text{ lb.}$$

In other words, it is only necessary to multiply the deceleration at any particular speed by 2,000/32.2 = 64.1 to obtain the tractive resistance at this speed, and to this the scale on the right of fig. 1 corresponds. Examination of the curve shows it to follow the law $Tr = 45 + 0.06\,v^2$, and it is, therefore, legitimate to say that the resistance to motion of the car is given by that equation.

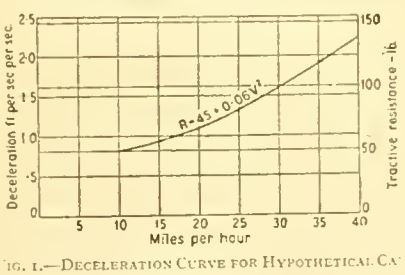

FIG. 1.—DECELERATION CURVE FOR HYPOTHETICAL CAR.
Weight of car, 1,900 lb.
Equivalent mass of rotating parts, 100 lb.

The large number of tests which have been made on cars and lorries with the Wimperis and Lanchester accelerometers, therefore, cover the ground fairly well so far as four-wheeled vehicles are concerned; but, unfortunately, the author has failed to find any published results of tests on motor cycles or sidecar outfits, and he has, therefore, been constrained to obtain the necessary experimental data himself.

The following alternative method of obtaining the desired information was, therefore, adopted. This method is simplicity itself, and requires no special instruments, since the whole of the figures required are obtained from an ordinary Bonniksen Isochronous speedometer. For practical purposes, it is sufficient to say that the instrument gives the speed of the vehicle every five seconds. When carrying out the tests, the machine is taken to a perfectly level stretch of road on a substantially windless day. It is then accelerated up to its maximum speed, and the gear lever slipped into neutral, the successive readings of the speedometer as the machine comes to a standstill being noted.

The following figures were obtained in this manner on a 6-7 h.p. B.S.A. sidecar outfit fitted with a windscreen of

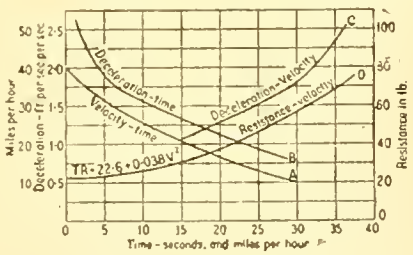

FIG. 2.—6 H.P. B.S.A. OUTFIT.
Easting type screen, right up.
Total weight, 950 lb.
Road, perfect tarmac, dry.

the Easting type. The total weight of the outfit loaded, including an allowance for the inertia of the wheels, was 950 lb., and the tests were made on a stretch of perfect tar macadam. Successive readings of the speedometer as the machine slowed down were as follows: 40, 31, 25, 21, 17, 13, and 10 m.p.h. These are plotted in the lower left-hand curve A in fig. 2 on a time base. Now it is evident that the slope of this velocity-time curve will give the deceleration-time curve, which is the upper left-hand line (B) in fig. 2, and from the two curves it is a simple matter to draw the deceleration curve on a velocity base (upper right-hand line (C) in fig. 2). This is the exact equivalent of the accelerometer curve given in fig. 1. In the particular case under consideration, this curve, when measured off by the correct scale, gives the values for tractive resistance stated in the second column of Table I. Examination of these figures shows that the curve is substantially that represented by $Tr = 22.6 + 0.038\,v^2$, the figures given

Comparative Motor Cycle Performances—

by this equation being given in the third column, while the fourth column gives the percentage error.

TABLE I.

Speed, Miles per Hour.	Resistance in lb.		Error per Cent.
	From Curve.	$R=22.6+0.038v^2$.	
15	31.0	31.0	0
20	37.6	37.6	0
25	45	46.1	2.4
30	53.1	56.4	6.2
35	68.6	68.7	0.15

The author suggests that this method of obtaining the tractive resistance curve is probably quite as accurate as the accelerometer method, since it involves the reading of one instrument only, and that instrument gives absolutely dead beat readings.

It is perhaps desirable to give some idea of the weight distribution on a typical sidecar combination, since the weight available on the driving wheel is often the limiting factor in climbing freak hills. The appended figures are

	Total.	Back Wheel.		Front Wheel.		Sidecar Wheel.	
		Weight.	Per Cent.	Weight.	Per Cent.	Weight.	Per Cent.
Empty	504 lb.	203 lb.	40	182 lb.	36	119 lb.	24
Driver only	658 lb.	318 lb.	48	227 lb.	34	113 lb.	17
Full load	840 lb.	350 lb.	42	276 lb.	33	214 lb.	25

for a 4¼ h.p. B.S.A. combination with an 11 stone driver and a 13 stone passenger.

It will be observed that with the outfit fully loaded 42% of the total weight is on the rear wheel. Therefore, if the coefficient of friction between the tyre and the road is 0.5, the tractive effort available is 21%, or, in other words, the

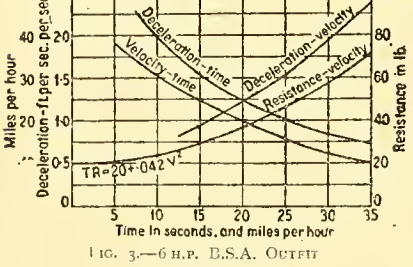

FIG. 3.—6 H.P. B.S.A. OUTFIT
No windscreen.
Gross weight, 950 lb.
Road surface, perfect.
$Tr=20+0.042v^2$.

maximum grade which can be climbed is about 1 in 5. The situation, however, is not so bad as this, because the effect of the gradient is to increase the rear wheel loading, and this tendency is still further helped by the driving torque, which is, of course, tending to lift the front wheel, and consequently to increase the load on the rear wheel. When it is remembered, however, that a really greasy surface probably gives a coefficient as low as 0.1 between the tyre and the road, it is easily seen that the proportion of total weight on the rear wheel is a most important matter.

To return to the question of tractive resistance, figs. 3, 4, and 5 represent the results obtained from a series of tests on a 6 h.p. B.S.A. combination, which, with driver and passenger, and an allowance for the inertia of the rotating parts, had a gross weight of 950 lb. The sidecar was fitted with a windscreen of the Easting type, and tests were made with the screen removed, with the screen in

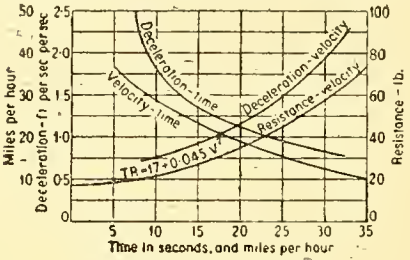

FIG. 4.—6 H.P. B.S.A. OUTFIT.
Easting type screen, in normal position
Gross weight, 950 lb.
Road surface, perfect.
$Tr=17+0.045v^2$.

the normal position, and with the screen thrown right up, in order to determine what effect, if any, the screen had on the wind resistance. Figs. 3, 4, and 5 represent the conditions in the order stated, the resistance curves being: $Tr=20+0.042\ v^2$, $Tr=17+0.045\ v^2$, $Tr=22.6+0.038\ v^2$.

These three resistance curves are plotted together in fig. 6 for purposes of comparison. It is notable, in the first place, that there is a considerable variation in the constant factor. This is difficult to explain, but it has been noticeable in all the tests which have been made, and the author is inclined to think that it is due to the fact that the Bonniksen instrument reads only to the nearest mile per hour. The possible error thus introduced is unimportant at relatively high speeds, but may be of sufficient importance at low speeds to affect the constant factor. An independent check is easily made by finding the friction angle of the outfit—that is, the slope on which it will just keep rolling at a steady speed without either accelerating or decelerating. In this case it was found that 20 lb. was the correct figure. The equations may, therefore, be restated as:

No screen ..... $Tr=20+0.042\ v^2$
Screen normal ... $Tr=20+0.045\ v^2$
Screen up ..... $Tr=20+0.038\ v^2$

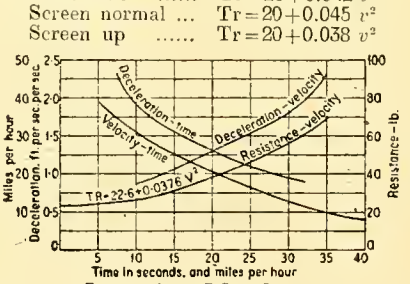

FIG. 5.—6 H.P. B.S.A. OUTFIT.
Easting type screen, right up
Gross weight, 950 lb.
Road surface, perfect
$Tr=22.6+0.0376v^2$.

The second point worthy of note is the very small effect of the screen on the v^2 factor, which shows that a curved screen of the Easting type has very little effect at all on the wind resistance. Actually, the resistance is slightly less when the screen is thrown right up than when no screen is fitted, which is to be expected in view of its streamlining effect. With the screen in the ordinary position the resistance is slightly increased, but only to a negligible extent. These statements, of course, apply only when there is a passenger in the sidecar.

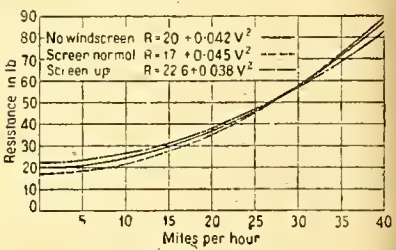

FIG. 6.—6 H.P. B.S.A. OUTFIT
Resistance velocity curves.

A similar series of tests was made on a 10 h.p. four-cylinder Henderson combination, fitted with a coach-built sidecar, the gross weight being 850 lb. In addition to the tests without a screen and with an Easting screen in the two positions, a test was made with a flat screen 18in. high by 24in. wide, set at about 70° to the horizontal. The resulting resistance curves are plotted in fig. 7, and give the following results:

No screen ..... $R=16+0.04\ v^2$
Easting screen, normal position ..... $R=16+0.04\ v^2$
Easting screen, right up $R=16+0.036\ v^2$
Flat screen ..... $R=16+0.044\ v^2$

It will be noted that in this case the addition of the Easting screen made no

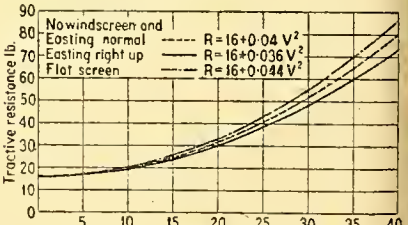

FIG. 7.—10 H.P. HENDERSON OUTFIT
(coachbuilt sidecar).
ractive resistance curves
Gross weight, 850 lb.
Road surface, perfect

difference whatever to the resistance when set in the normal position, but that when right up it decreased the resistance as in the previous case. The use of a flat windscreen, however, increased the v^2 factor by exactly 10%, as would be expected.

The sidecar was then removed and replaced by a smaller cane sidecar, the gross weight of the outfit then being 780 lb. Tests were made with no screen, with a flat screen as before described, and also with the sidecar empty and covered by a tightly stretched apron so as to streamline it as far as possible. The resulting curves are shown in fig. 8, and give results as follows:

Comparative Motor Cycle Performances—

No screen ...	$Tr = 14 + 0.032\ v^2$
Flat screen ...	$Tr = 14 + 0.037\ v^2$
Sidecar empty	$Tr = 10 + 0.028\ v^2$

It may be noted here that the reduction in weight from 850 lb. to 780 lb.

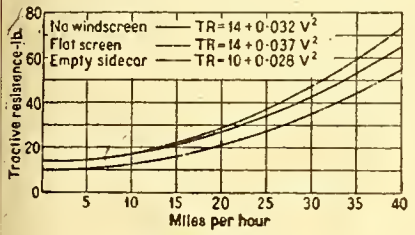

FIG. 8.—10 H.P. HENDERSON OUTFIT (cane sidecar).
Tractive resistance curves.
Gross weight, 780 lb.
Road surface, perfect.

gives a reduction of 2 lb. in the constant factor, while the further reduction of 140 lb. in weight due to the absence of the passenger reduces the constant by a further 4 lb. This would appear to indicate that the constant might be taken at 2 lb. for every 70 lb. of weight. If this were the case, however, the constant factor for the outfit at 850 lb. would be 24.3 lb. instead of the actual 16.

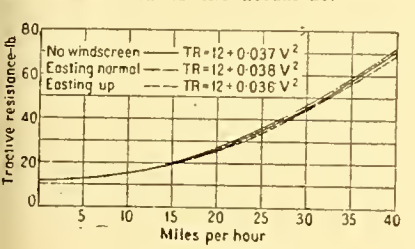

FIG. 9.—4¼ h.p. B.S.A. OUTFIT.
Tractive resistance curves.
Gross weight, 780 lb.
Road surface, perfect.

A 4¼ h.p. B.S.A. outfit gives very similar figures :

No screen	$Tr = 12 + 0.037\ v^2$
Easting, normal	$Tr = 12 + 0.038\ v^2$
Easting, up	$Tr = 12 + 0.036\ v^2$

The weight of this outfit was 780 lb., and the wind resistance perhaps rather less than usual for that type of vehicle, since the sidecar body was set very close in to the machine. The same machine was tested solo, with the rider sitting upright, and then with head down in as near a racing posture as possible, in view of the fact that the speedometer had to be kept in view. Resistances were as follows :

Sitting up	$Tr = 8 + 0.02\ v^2$
Semi T.T.	$Tr = 8 + 0.015\ v^2$

These figures are plotted in figs. 9 and 10 respectively.

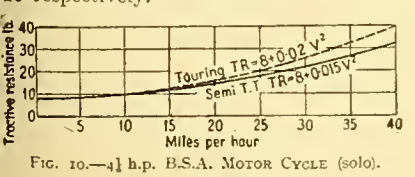

FIG. 10.—4¼ h.p. B.S.A. MOTOR CYCLE (solo).
Tractive resistance curves.
Gross weight, 440 lb.
Road surface, perfect.

Table III. gives a summary of the results in general terms, and covers all types and sizes of machines. In the case of sidecar outfits, the projected area of the outfit, with driver and passenger seated, is given in order that the comparative sizes of the three classes for which figures are given may be realised. While, of course, these figures are not likely to represent very accurately the tractive resistance of any particular machine, yet the author feels sure that they are good average figures, which may fairly be used for any analysis.

Engine Performance.

It is not an easy matter to obtain a representative set of power curves which will cover all sizes of engines. Some of the curves considered in the paper have been obtained by the author himself on a Froude dynamometer, but for others he is indebted to various outside sources.

TABLE III.

Machine.	Windage.	Tr.
	sq. ft.	
Large sidecar outfit	20	$20 + 0.042v^2$
Medium sidecar outfit	18	$16 + 0.04v^2$
Small sidecar outfit	16	$12 + 0.037v^2$
Large solo touring	—	$8 + 0.02v^2$
Large solo semi-T.T.	—	$8 + 0.015v^2$
Large solo racing	—	$6 + 0.01v^2$
Small solo touring	—	$6 + 0.015v^2$
Small solo semi-T.T.	—	$6 + 0.012v^2$
Small solo racing	—	$6 + 0.009v^2$
Large sidecar racing	12	$10 + 0.02v^2$
Small sidecar racing	10	$8 + 0.018v^2$

In connection with this, however, it must be remembered that air-cooled engines are difficult to test on a dynamometer, because the power output varies somewhat with the cylinder temperature. A side-valve engine of normal design will often show a difference of 10% in brake mean effective pressure between dead cold and steady hot running. The author's method is to vary the velocity of the cooling air with the engine speed,

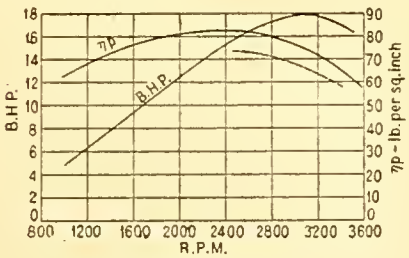

FIG. 11.—1918 HARLEY-DAVIDSON 7-9 H.P. ENGINE.
Power curves.
Capacity, 989 c.c.
Compression ratio, 3.7 to 1.

and to wait until the engine has reached a steady temperature before taking any readings. Figures obtained in this way are evidently the only ones of real value.

In fig. 11 is given a power curve for a 1918 Harley-Davidson 7-9 h.p. twin-cylinder engine. The dotted line is the ηp curve for a 1916 Henderson. This curve has been deduced from the known tractive resistance and the known maximum speed of the machine on various gear ratios. If an allowance of 90% is made for the efficiency of the Henderson transmission, the Henderson curve approximates to that for the Harley.

Fig. 12 shows the results obtained from a standard 6 h.p. B.S.A. engine, 76 mm. bore × 85 mm. stroke = 770 c.c. The lowest curve is for petrol consumption with full throttle, in pints per brake horse-power per hour of No. 1 petrol.

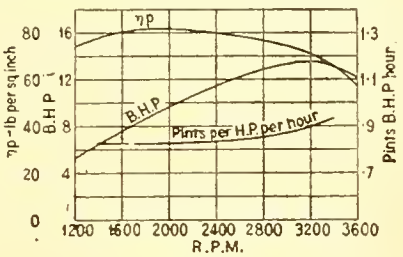

FIG. 12.—6 H.P. B.S.A. ENGINE.
Power curves.
Capacity, 770 c.c.
Compression ratio, 3.6.

The curves in fig. 14 are for a 1920 type 4¼ h.p. B.S.A. single-cylinder engine. Curve A, shown as a full line, is for a standard engine with the usual compression ratio of 3.52 to 1. The test was made after the engine had been carefully tuned up to give the best results,

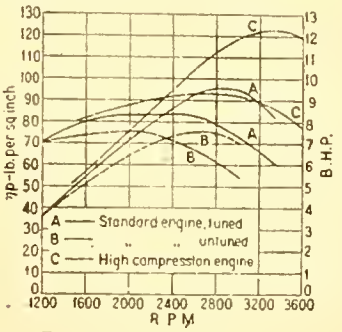

FIG. 14.—4¼ H.P. B.S.A. ENGINE.
Power curves.
Capacity, 557 c.c.
Compression ratio, 3.6 to 1.

the only alteration from standard being that a few holes had been drilled in the piston skirt. After several thousand miles running, the engine was again tested, without being tuned up, and curves B were obtained, giving a maximum ηp of 76 lb. per sq. in. and a maximum brake horse-power of 7.6 at 2,700 r.p.m. Curves C are for a similar engine with a dome-topped piston, giving a compression ratio of 4 to 1, and light reciprocating parts. Both these engines are of the standard side-valve type, with cast iron pistons and ordinary cams. The valve timing of the engine to which curves A and B apply was as follows :

Inlet opens 8° late, closes 55° late.
Exhaust opens 57° early, closes 14° late.

It may be mentioned that a bench test of another make of 4 h.p. single-cylinder engine 85 mm. bore × 97 mm. stroke, equal to 550 c.c. capacity, gave a maximum ηp of 76 lb. per sq. in. and a maximum brake horse-power of 9.2 at 2,900 r.p.m., which is not quite so good as curve B in fig. 14. With an open carburetter, the petrol consumption of the 4¼ h.p. B.S.A. engine with the standard compression ratio is about 0.9 pint per brake horse-power per hour. With the standard air gauze fitted it falls to 0.8 pint, and if a special hot air pipe be fitted it may even be as low as 0.7 pint at full load.

(To be continued.)

Time Trials and Racing.

First 1921 B.M.C.R.C. Members' Meeting at Brooklands. A Disputed Finish in 500 c.c. Three-lap Race.

BROOKLANDS enthusiasts were intensely relieved to hear that the transport strike was "off" last Friday evening, for, if it had not been so, there would have been no racing on Saturday.

The weather was not too unkind, because all the snow showers considerately avoided Brooklands, but at times it was too cold to be pleasant. First came the kilometre and mile time trials, starting at noon. To be eligible for the gold medal awarded for the best aggregate performance in each class during the 1921 season, members must have competed in all but two of the series of time trials (flying start). Only one record was broken, and this was by Kaye Don, who signally distinguished himself.

CLASS A.—NOT EXCEEDING 250 c.c.

CLASS F.—WITH SIDECAR, NOT EXCEEDING 600 c.c.

1. G. Dance (Sunbeam) ...	32	69.90	53⅜	67.42
2. V. E. Horsman (Norton)	38⅜	57.95	62⅛	57.51

CLASS G.—WITH SIDECAR EXCEEDING 600 c.c., NOT EXCEEDING 1,000 c.c.

1. H. Le Vack (Indian)	30⅜	72.63	49⅜	72.58
2. J. Marchant (Zenith) ...	33	67.79	53⅛	66.91
3. S. E. Longman (Harley-D.)	34⅛	64.28	56⅜	63.38
J. A. O'Sullivan (Harley-D.)	35⅜	63.19	57⅛	62.28
O. de Lissa(Motosacoche)	34⅛	65.41	59⅜	60.4
R. Dequin (Zenith)	38	58.87	61⅞	58.63
A. J. Rowe (Harley-D.) .	38⅛	57.65	56⅛	63.38

BROOKLANDS, A POPULAR RENDEZ VOUS.—Visitors' motor cycles at the fork last Saturday, when some good sport was witnessed.

CLASS H.—CYCLE CARS, NOT EXCEEDING 1,100 c.c.

	Kilom. sec.	Kilom. m.p.h.	Mile. sec.	Mile. m.p.h.
1. E. B. Ware (10 Morgan-Jap)	31⅛	70.34	51⅛	69.50
2. E. Longden (8 Morgan-Jap)	48	49.63	73⅛	48.78

Racing proper began at the conclusion of the time trials, and provided some excellent sport. As is customary in the case of members' meetings, the events started and finished at the fork, so that all that happened took place in full view of the spectators. As the races were of three laps only, the meeting was bright, and provided a number of close finishes. There were several absentees owing to the strike. Col. R. N. Stewart, who was to have ridden the newly-revived Trump-Jap, had gone back to his old regiment the Gordon Highlanders, and the Martin works had been commandeered that morning.

There was some delay in starting the first event, caused by the time taken to unscrew the electrical timing tapes; but, owing to the strenuous work of the officials, the later races were run off to schedule. The first of the three-lap scratch races was for machines not exceeding 250 c.c.

Fast Lightweights.

Prestwich's Diamond-Jap had a large aluminium inlet valve cap and a fir cone pattern radiator over the exhaust valve cap. It also had an ingenious handlebar-controlled oil pump fitted to the rear end of the tank. Don's engine, a Diamond, was of a new type, and had overhead valves. At the start the Velocette got away first, but was well behind at the end of the first lap. Prestwich was leading, but Don appeared to be pressing him hard. On the second lap Prestwich increased his lead, and won easily. Don finished in trouble, and Tollady completed the course. Result: 1, J. V. Prestwich (Diamond-Jap), 60.10 m.p.h.; 2, K. Don (Diamond); 3, J. W. Tollady (Velocette).

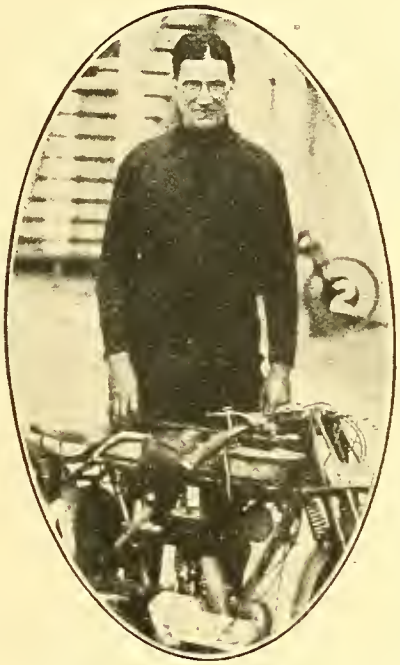
All made a good start in the second race, which was for motor bicycles not over 350 c.c. capacity. Remington was riding a Blackburne with overhead valves, while Preston's Singer had an aluminium cooling plate on the cylinder head, and a Bowden extra air inlet in the inlet pipe.

Overhead Valve Engines to the Fore.

The first lap order was Thompson, leading easily, Remington, E. Longden, T. Eve, V. Longden, Tollady, Aitken, and Preston. In the second lap Thompson was still leading, but Remington was gaining on him. E. Longden ran third, and then followed V. Longden and Tollady. Remington won comfortably. Result: 1, E. Remington (Blackburne), 61.69 m.p.h.; 2, T. Thompson (Douglas); 3, E. Longden (Dot-Jap).

The next race was for Class C motor bicycles (500 c.c.) and marked the first public appearance of the Zenith with the flat twin Bradshaw oil-cooled engine; however, it suffered from oil getting on the belt. Dance's overhead valve Sunbeam was fitted with a mechanical oil pump. The acceleration of his engine, which has two valves with outside tappet rods, was tremendous.

Horsman led the field at the end of the first lap, followed by Kennedy, Dance, Emerson, Thorpe, F. A. Longman, Carter, and Ayres. Kennedy gained first place on the second lap, with Horsman second, and with Thorpe and Emerson striving for second place, then followed Longman and Ayres well in the rear. It was a close finish, and Horsman was clearly the winner, but owing to an error of judgment Kennedy was declared by the judge to have come in first. Not a single soul among the spectators agreed with this decision, but it was duly given out, and bets were consequently paid. Eventually the judge had to acknowledge that he had made a mistake, but this unfortunate incident created much discontent and not a little adverse comment on the decision. Result: 1, V. E. Horsman (Norton) 73.78 m.p.h.; 2, P. Kennedy (Norton) 3, H. Thorpe (Douglas).



ne Trials and Racing—

Next came the Class D (750 c.c.) race motor bicycles not exceeding 750 c.c. rsman again distinguished himself, as kept first place throughout. At the d of the first lap he was followed by orpe, Emerson, and Collard; in the xt lap by Emerson and Collard; and ished first easily. Result: 1, V. E. rsman (Norton), 73.56 m.p.h.; 2, J. nerson (Zenith-Bradshaw).

Starting Difficulties.

A genuine trial of the new B.M.C.R.C. e to the effect that machines must t be pushed off more than thirty rds from the starting line occurred the Class E race. This proved some- at difficult in the case of the 1,000 . engines, but all got off somehow, but oodhouse and Le Vack did not find the rt too easy. It was a truly exciting e. Davidson, who was first away at start, kept his lead, but Woodhouse lowed him closely at the end of the first ; then came Le Vack and Harveyson. mple was clearly in trouble, and Garrett ired. At the end of the second lap vidson increased his lead, Le Vack s second, and next came Woodhouse. rveyson, and Don. Davidson won by out three lengths. Result: 1, D. H. vidson (Harley-Davidson), 80.66 m.p.h.; H. Le Vack (Indian); 3, J. Woodhouse artin).

In Class F scratch race (sidecars not ceeding 600 c.c.). Horsman not only ain proved himself to be a fine rider endidly mounted, but somewhat of a morist. Longman (Ariel sc.) was the y man to arrive to time at the start, d was sent off as a walk-over. Horsman rived later and was surprised to find nself alone. He then had an argument

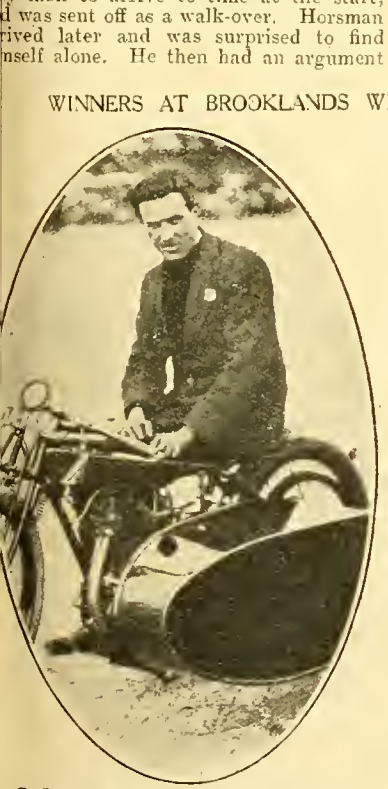
V. Horsman (3½ Norton), winner of the 500 c.c. three-lap race at 73.78 m.p.h.

with Mr. J. L. Norton as to whether he should start, and by the time he was persuaded Longman was two miles ahead at least. Horsman then got to business, and, lapping at 61½ m.p.h., easily won his self-imposed handicap. It was hard luck on Longman, who must have been unaware of his rival until passed by him. Result: 1, V. Horsman (Norton sc.), 45.48 m.p.h.; 2, F. A. Longman (Ariel sc.).

The three-lap scratch race for Classes F and G for motor cycles with sidecars not exceeding 1,000 c.c. was well supported and worth watching. J. Marchant, one of the co-designers of the Flexi carburetter and the Blériot-Whippet cycle car, was riding the Zenith, which was fitted with a special engine with overhead valves and mechanical oil pump; this machine was entered by Mr. F. W. Barnes.

Le Vack and Marchant fought hard for the lead at the end of the first lap, and then followed Horsman, S. E. Longman, de Lissa, O'Sullivan, Rowe, and Dequin. In the second lap Le Vack still led the field, with Marchant, Longman, Horsman, de Lissa, O'Sullivan, Rowe, and Dequin behind him. Le Vack won by about four lengths. Result: 1, H. Le Vack (Indian sc.), 63.20 m.p.h.; 2, J. Marchant (Zenith sc.); 3, S. E. Longman (Harley-Davidson sc.).

Only two cycle cars, the Morgans entered by Ware and Longden, took part in the last race. Ware's mount had side-by-side valves, but a larger cylinder capacity than Longden's, which had the old type overhead valve J.A.P. engine. Ware just played with his rival, and won comfortably. Result: 1, E. B. Ware (10 Morgan), 52.15 m.p.h.; 2, E. Longden (8 Morgan).



The following records fell during the meeting:

250 c.c. FLYING FIVE MILES (world's record if confirmed).—J. V. Prestwich (2½ Diamond-Jap), 4m. 53⅘s. = 60.95 m.p.h. = 98.09 k.p.h.

500 c.c. SIDECARS FLYING FIVE MILES (British record and world's record if confirmed).—V. Horsman (3½ Norton sc.), 4m. 41⅗s. = 64.01 m.p.h. = 103 k.p.h.

1,000 c.c. SOLO FLYING FIVE MILES (British record).—H. H. Davidson (7-9 Harley-Davidson), 3m. 30⅗s. = 85.44 m.p.h.

WINNERS AT BROOKLANDS WITH OVERHEAD VALVE ENGINES WHICH MAY COMPETE IN THE T.T

G. Dance (Sunbeam), fastest in the 350 c.c. class time trials at 86.70 m.p.h.; in the races he rode a 3½ h.p. machine but was not placed

Kaye Don (2½ Diamond), who beat O'Donovan's Velocette record and made fastest time in the 250 c.c. time trials. His speed was 69.62 m.p.h.

E. Remington (2¾ Blackburne), winner of the 350 c.c class race at 61.69 m.p.h. His machine is a new model with overhead valves.

CURRENT CHAT (Continued from p. 498).

An unlucky competitor in the York and District M.C. open hill-climb at Sutton Bank prior to stripping his second gear. Incidentally the illustration depicts L. Mitchell mounting the steepest portion just an unusual viewpoint.

A Reunion.

The second annual reunion dinner of the 37th Divisional Signal Company will take place on Saturday, May 7th, at the Swan Hotel, Stafford. Ex-members interested should write T. S. Anderson, Queensville, Stafford.

T.T. Entries.

To the lists already published of intending competitors in the T.T. races must be added the Velocette entry in the Junior event, George Denley being the nominated rider; while in the Senior Morton H. Edmonds has entered a Triumph.

A Product of Southport.

Last week we described and illustrated on page 458 a folding cycle car known as the Dandy; this machine is manufactured by James Sumner and Sons, 2, Latham Road, Southport.

The London-Edinburgh Run.

Entries closed for the M.C.C. Whitsuntide run to Edinburgh on Tuesday, and it was confidently expected that the 400 mark would be reached. 150 entries for motor cycles and three-wheelers had been received up to last week end, approximately half of which number were solo riders. Among the three-wheelers to make their *début* in competition will be the Scott Sociable and the Dandy cycle car.

Faith in our Omniscience.

Our queries department is frequently taxed to the utmost by the complication and vagueness of some of the problems propounded, but it is occasionally taken right outside the motor cycle field by some trustful reader. A recent example is the case of one who wishes to know how to remove the chalk-like deposit of "fur" from the inside of the domestic copper kettle. A water-cooling enthusiast on our staff tartly suggested that the answer was a lemon!

Motor Fuels from South Africa.

There are several motor fuels made in Africa, and among these the best known is Natalite, which we tried, with some success, during the war. It had, however, one disadvantage, and that was that it apparently had a very adverse effect upon the carburetter of the machine on which it was tested, which was constructed of an aluminium alloy. Unfortunately, Natalite is mainly composed of alcohol, and as this is the case, if imported into this country, it would be subject to a duty of £2 15s. a gallon.

Another fuel is known as Penrol, and is made by the Penrol Motor Fuel Ltd. The fuel has been subjected to very severe tests, including some 5,000 miles actual running in motor cars, motor cycles, and lorries, and it is stated to be non-corrosive, has no unpleasant smell, is colonred blue, does not stain, and is smokeless. It also develops high power, starts easily from cold.

A lady competitor who rode well at the York and District M.C. Open Hill-climb at Sutton Bank. Miss F. E. Dent rounding the bend on her 3¾ h p. Scott Squirrel.

High Speeds on Axe Edge.

Re-run of the Stockport Open Hill-climb.

ALL the classes in the Stockport and District M.C. open climb on Axe Edge, which had to be abandoned on March 19th, were re-run on Saturday. Formula results have not yet been verified, but the following are the time results in the open and closed events. The closed classes were run on time only. G. W. Walker (3½ Norton) made fastest ascent of the day in the surprising time of 57s. Several of the previous entrants were absentees. Results :

Open Events.

CLASS 3.—SOLOS TO 500 c.c.

		M.	S.
1.	G. W. Walker (3½ Norton) ...		57⅘
2.	H. R. Davies (2¾ A.J.S.) ...	1	3⅘
3.	T. Simister (3½ Norton) ...	1	5⅘

CLASS 4.—SOLOS TO 750 c.c.

1.	H. R. Davies (2¾ A.J.S.) ...	1.	0	⅘
2.	G. W. Walker (3½ Norton) ...	1	2	⅘
3.	T. Simister (3½ Norton) ...	1	3	

CLASS 5.—SOLOS TO 1,000 c.c.

1.	G. W. Walker (3½ Norton) ...		57	
2.	H. R. Davies (2¾ A.J.S.) ...	1	2	
3.	T. Simister (3½ Norton) ...	1	2	⅘

CLASS 6.—SOLOS (Unlimited c.c.).

1.	G. W. Walker (3½ Norton) ...		57	⅘
2.	H. R. Davies (2¾ A.J.S.) ...	1	2	
3.	T. Simister (3½ Norton) ...	1	3	⅘

Closed Events.

CLASS 2.—SOLOS TO 350 c.c.

1.	E. Cowley, jnr. (2¾ Dallon) ...	1	22	
2.	B. Parkinson (2¾ Douglas) ...	1	26	⅘
3.	F. Cheetham (2¾ Dot)	1	28	⅘

CLASS 3.—SOLOS TO 500 c.c.

1.	E. S. Abram (3 A.B.C.)	1	16	⅘
2.	E. Cowley, jnr. (2¾ Dallon) ...	1	19	⅘
3.	F. Cheetham (2¾ Dot)	1	23	

CLASS 4.—SOLOS TO 500 c.c.

1.	G. W. Walker (3½ Norton) ...		57	⅘
2.	T. Simister (3½ Norton) ...	1	1	⅘
3.	F. H. Andrews (3½ Norton) ...	1	10	⅘

CLASS 5.—SOLOS TO 750 c.c.

1.	T. Simister (3½ Norton) ...	1	1	⅘
2.	F. H. Andrews (3½ Norton) ...	1	7	⅘
3.	E. S. Abram (3 A.B.C.)	1	14	

CLASS 6.—SOLOS (Unlimited).

1.	T. Simister (3½ Norton) ...	1	1	⅘
2.	F. H. Andrews (3½ Norton) ...	1	8	⅘
3.	F. Boulton (7-9 Indian) ...	1	10	⅘

CLASS 8.—SIDECARS TO 500 c.c.

1.	T. Simister (3½ Norton sc.) ...	1	24	
2.	W. Preston (3½ Sunbeam sc.) ...	1	39	

CLASS 9.—SIDECARS TO 1,000 c.c.

1.	T. Simister (3½ Norton sc.) ...	1	21	
2.	W. Preston (3½ Sunbeam sc.) ...	1	34	⅘
3.	E. Cowley, jnr. (3½ Norton sc.)	1	44	

CLASS 10.—SIDECARS (Unlimited).

1.	T. Simister (3½ Norton sc.) ...	1	23	⅘

100 m.p.h. AND THE "3½."

AS the outcome of our paragraph in last week's issue regarding the possibility of the speed of a 3½ h.p. motor cycle touching 100 m.p.h. this year, Mr. C. Binks, of carburetter fame, writes us that it is his intention to present a silver cup, value £50, to the first rider who accomplishes this speed.

"The matter is one of the very greatest importance to motor cyclists," says Mr. Binks in writing us about his offer, "as it not only shows that the machine capable of accomplishing this speed is of the very highest efficiency, but is one that is likely to last practically for ever under ordinary touring conditions."

We agree with Mr. Binks that very few riders have any conception of the terrific strain to which an engine is subjected in maintaining such a high speed.

Conditions applying to this award may be obtained from C. Binks, Ltd., Church Street, Eccles, Manchester.

THE PARIS-PYRENEES-PARIS TRIAL.

AS has already been mentioned in *The Motor Cycle*, owing to difficulties with the Spanish authorities, the Spanish portion of the Paris-Madrid Trial has been cut out. Consequently, the competition has been altered to a week's trial from Paris to the Pyrenees and back again.

THE PROGRAMME OF THE RUN.

Saturday, April 30th.—Paris to Poitiers.
Sunday, May 1st.—Poitiers to Bordeaux.
Monday, May 2nd.—Bordeaux to Pau.
Tuesday, May 3rd.—Pau among the Pyrenees to Toulouse.
Wednesday, May 4th.—Toulouse *via* Castelsarraziu, etc., to Bordeaux.
Thursday, May 5th.—Exhibition of competitors' machines at Bordeaux.
Friday, May 6th.—Bordeaux to Poitiers.
Saturday, May 7th.—Poitiers to Paris.

The trial is open to constructors or owners of motor cycles, but private owners will, of course, have to sign a declaration that they are not connected with the trade. Entries cost 250 francs for those in the trade, and 125 francs for private owners. These close at double fees at midnight, April 24th, and should be sent to the organising committee of the Paris-Pyrenees—Paris Trial, offices of *Moto-Revue*, 5, Rue Saint-Augustin, Paris.

The machines must belong to the usual classes, and must conform with the F.I.C.M. regulations as regards equipment.

LAST SATURDAY'S YORK AND DISTRICT M.C. OPEN HILL-CLIMB AT SUTTON BANK.

R. W. Stanfield, who obtained second place in Class 4, on his 3¾ h.p. Scott.

TESTING INTERNAL COMBUSTION ENGINES.

PROF. A. M. LOW, lecturing at Wolverhampton Engineering Society last week, explained several new methods which he considered might be adopted with great advantage by some makers, who seem to rely too much upon the private user to test their machines.

The lecturer pointed out how various parts of the frame of a motor cycle or chassis were linked with the engine itself, and explained that a fault in transmission, springing, or rigidity might lead to engine trouble apparently not in any way connected with the real cause. Prof. Low instanced the case of racing motor cycles, which will break a piston often at the same bump on a track, due to absorption of stored energy. He explained how easy it was to measure periodicity of vibration in an engine, and thus to detect the cause and properly damp it out.

A demonstration was given of the method employed to indicate beats in an exhaust pipe, and, finally, a method of determining the exact moment when the opening of a valve becomes effective was shown by the oscillographic manograph.

The Motor Cyclists' Parliament.

First Meeting (1921-22 Session) of the Auto Cycle Union General Committee.

THE Royal Automobile Club was the venue for the first meeting of the A.C.U.'s new year. Other meetings will be held in the provinces—Taunton in July on a Friday, and on certain Saturdays at Leicester in October and Bournemouth in December.

At the beginning, the chair was occupied by the Hon. Sir Arthur Stanley, G.B.E., C.B., M.V.O., who, as was customary, occupied that post until the new chairman was elected. Lieut.-Col. A. E. Davidson, D.S.O., was, unfortunately, kept away owing to urgent military duties, and it is with regret that his retirement from the post of chairman of the A.C.U. has to be announced.

The first business was to elect a new chairman, and Col. F. S. Brereton, C.B.E., was unanimously chosen to fill the vacancy. On occupying the chair, Col. Brereton affirmed he would do everything in his power to support the Union, and concluded by speaking most eulogistically of the excellent work carried out by his predecessor.

The four new vice-presidents of the A.C.U. are the Rev. E. P. Greenhill, Messrs. H. P. E. Harding, E. J. Bass, and W. H. Wells.

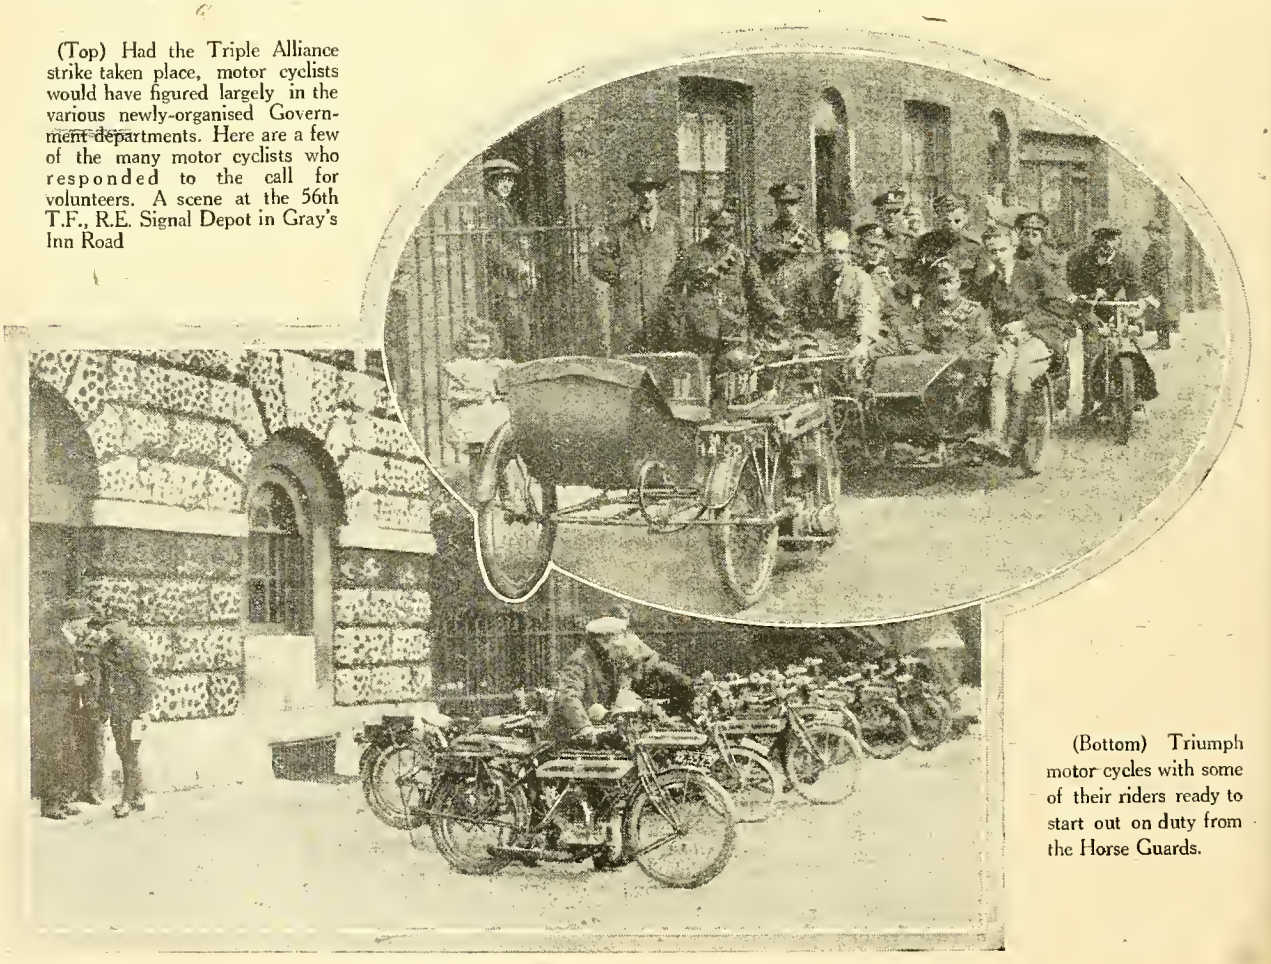
Mr. Stanley Carter was re-elected hon. treasurer.

During the ballot for these officials, the Secretary mentioned the necessity of motor cyclists who would care to represent England in the International Touring Trial in Switzerland sending in their names at an early date.

Announcements of Closed Trials.

Mr. W. H. Wells raised a point concerning Competition Rule 107 dealing with the power of the Auto Cycle Union to disqualify any entrant advertising extensively performances made in a closed trial.

Mr. Loughborough, in reply, said that he considered this rule to be both good and sound, but it was only intended to be enforced when such a trial was organised directly against the interests of the Union.



The next item on the agenda was the election of the Competitions and Touring Committee, and in this connection some discussion ensued regarding the re-election of a certain member of the former who was directly connected with the manufacture of engines, and it was finally decided that he was not eligible.

The new Competitions Committee now consists of Messrs. F. H. Bevan, E. Featherstone, Alec S. Ross, A. V. Ebblewhite, A. G. Reynolds, W. Cooper, N. Longfield, J. W. G. Brooker, Lieut.-Col. F. Lindsay Lloyd, C.M.G., Lieut-Col. D. F. Nicholl, D.S.O., Major J. R. Potter, and Dr. A. M. Low, D.Sc. The Rev. E. P. Greenhill is an *ex-officio* member of this committee.

The 1921 Touring Committee is composed of Messrs. E. B. Ware, J. W. G. Brooker, S. R. Axford, E. M. P. Boileau, H. Johnson, D. H. Noble, R. I. M. Samuel, B. Marians, T. Rutherford, Major R. V. C. Vernon Brook, and Lieut.-Com. G. H. Pierce, R.N.R.

The proceedings terminated with an urgent appeal by the Chairman for assistance in the present national crisis from the A.C.U. in the shape of motor cycle despatch riders. He trusted members would do their utmost to help the Management Committee in this direction.

Under the heading "Other business," Major Axford brought up the subject of motor cycle championships, suggesting that this question should be deputed to the Centres, but the matter was deferred until the next meeting.

(Top) Had the Triple Alliance strike taken place, motor cyclists would have figured largely in the various newly-organised Government departments. Here are a few of the many motor cyclists who responded to the call for volunteers. A scene at the 56th T.F., R.E. Signal Depot in Gray's Inn Road

(Bottom) Triumph motor cycles with some of their riders ready to start out on duty from the Horse Guards.

54 Entries in A.C.U. One Day Trial.

BELOW we give a list of entries in next Wednesday's A.C.U. One Day Trial. On point of numbers the entry is, perhaps, a little disappointing, especially as only one four-wheeled cycle car is down to compete, and this a monocar. Examination of the list will show that the majority of entrants will ride solo machines, less than a dozen being included in the passenger class. The proportion of lightweights is about 40%. "Stock" machines could be specially entered in this event, and eleven manufacturers are taking this opportunity of convincing demonstration.

CLUB NEWS.

Saltcoats and District M.C.C.

There is already a membership of forty in this newly-formed club. Mr. J. Kirkland, of Thornley, Saltcoats, is the hon. secretary.

Essex County and Southend A.C.

At a recent meeting it was decided to re-name the Southend-on-Sea A.C. as above. This club, in conjunction with the Essex M.C., is holding open speed trials at Southend on July 7th.

Burton and District M.C.C.

Only fourteen competitors were attracted by the recent trial in the Peak District. A difficult course and adverse weather conditions reduced the finishers to five. Results: 1, P. B. Cheston (3½ Norton sc.); 2, R. G. Redfern (6 A.J.S. sc.); 3, N. A. Findlay (7 A.J.S. sc.).

Halifax and District M.C.C.

Over a course of 168 miles, the trial on the 10th inst. included such well-known Yorkshire hills as Greenhow, Keighley Gate, and Holme Moss. The results are now to hand, and are as follows: 1, C. Adams (4 Triumph sc.); 2, F. E. Jackson (7-9 Harley-Davidson sc.); 3, A. Youngman (6 W.D. Clyno sc.).

North-eastern Centre A.C.U.

The entry fees for the open trial for the Travers Trophy (value 200 guineas), which will be held on the 30th inst., have been reduced as follows: Trade entry, £2 2s.; trade members of club, £1 10s.; private riders, £1 10s.; and club members, £1 1s. Entries close on April 23rd. The secretary for this event is Mr. Stanley Bell, Newcastle and District M.C.C., 77, Pilgrim Street, Newcastle-on-Tyne.

Wellingboro', Rushden and District M.C.C.

About forty attended the first annual dinner last Friday, which was a distinct social success.

Leeds M.U.

Official results have now been announced of the ninety-mile trial for Mitchell Trophy: 1, R. A. Bonner (3½ N.U.T.); 2, F. E. Palmer (2¾ Edmund); 3, C. Woodhouse (3½ P. and M.); 4, S. Jepson 6 A.J.S. sc.); 5, P. Richardson (4 Triumph).

Lancaster and Morecambe M.C.C.

Results of the seventy-six miles reliability trial (*via* Kendal, Sedbergh, Dent, Whiteshaw Moss, Thornton, and Linnesdale) are as follows:

SOLO CLASS.—1, W. E. Atkinson (3½ B.S.A.); 2, J. Garlick (3½ Sunbeam), who both survived the test without loss of marks.

SIDECAR CLASS.—1, G. W. Read (6 A.J.S. sc.).

BRONZE MEDALS (for losing under 20 marks).—A. K. Gill (4½ B.S.A.) and E. Varley (3½ Norton).

Sheffield and Hallamshire M.C.C.

There were twenty-three entries in the trial for the F.B. Roper Amateur Shield on Saturday, of whom eighteen completed the course. Considering the nature of the route, it is great credit to the men that so many finished, as it was a stiff test, and there were really very few marks lost. The first three men all lost no marks at known checks or on hills, and it was only by bringing in the secret checks that they could be separated and the final results marked out (subject to final confirmation). Results:

1, L. Padley (3½ Norton), the Roper Shield and club gold medal; 2, P. H. Dudley (4¼ B.S.A.), half-pint e.p.n.s. tankard; 3, E. S. Sneath (2¾ Levis), half-pint e.p.n.s. tankard; 4-5 (tie), R. May (4 Norton sc.) and F. Marks (3½ Rudge), club bronze medal; 6, S. C. Ashby (3½ Scott), club brooze medal.

Whitchurch M.C.C.

It is proposed to form a club in this district, and a meeting will be held for that purpose at the Swan Hotel, Whitchurch, Salop, on Monday, April 25th.

Plymouth and District M.C. and L.C.C.

To race over thirteen miles of the wild ruggedness of Dartmoor was certainly a test of endurance which required some achievement, but such was the task set and successfully accomplished by two members of the club last week for a silver cup presented by Major H. Moon, while the second man received a club medal. The course selected was over the moorland from South Brent station to the Duchy Hotel, Princetown. Glorious sunny weather prevailed, and eight competitors lined up at the starting point for the race, being accompanied by five horsemen as pilots. Six competitors retired after covering about three miles, but S. L. Snell (hon. sports secretary), riding a 4 h.p. Triumph, and M. Dawes, on a 3 h.p. A.B.C., plodded determinedly onwards, following sheep and pony tracks, and wending their ways through the clitter and patches of marsh. Dawes maintained the lead until about a mile from Princetown, when by hard driving the Triumph rider forged ahead, and just managed to win by fifty yards.

Blackpool and Fylde M.C.

At the monthly meeting of the above club, arrangements were made for a hundred miles non-stop run on May 22nd. Mr. Sharples mentioned the possibility of the old trotting track at Whitegate Park being enlarged and banked. If such a track were laid out, it might pay for itself by being used for various trials for North of England clubs.

Club News.—

Blaina and District M.C.C.

On Wednesday, the 13th inst., the club held its first competition—a speed-judging event. Results: 1, W. Jennings (7-9 Harley-Davidson sc.), 30s. error; 2, A. Lawley (4¼ B.S.A. sc.), 1m. 30s. error.

Rochester, Chatham, and District M.C.

Rumours have gained currency that this club has been disbanded. This is not so; for, as a matter fact, reorganisation finds the body in a very strong position. It is still affiliated to the A.C.U. Any further information will be supplied by the assistant hon. secretary, Mr. H. J. Lawrence, 300, High Street, Chatham.

Standard M.C.C. (Coventry).

Inclement weather somewhat reduced the attendance at the recent flexibility hill-climb on Chesterton Mill Hill. W. Wilday (4 Triumph) took the highest award, while B. Edwards (3½ Norton sc.) and G. Thomas (4 Triumph sc.) actually made respectively fastest and slowest times.

Wolverhampton M.C.C.

From the final results (given below) of the trial on the 9th inst., it will be observed that the locally-built machines had quite a "day out."

1. F. W. Giles (7 A.J.S. sc.), Corke Cup and gold medal.
2. W. Worrall (3½ Sunbeam), Shepherd Cup and gold medal.
3. A. Bennett (3½ Sunbeam), gold medal.
4. T. C. Greenwood (3½ Sunbeam), Club Silver Cup.
5. A. H. Mee (2¼ Diamond), silver medal.
6. A. E. Ford (2½ Diamond), silver medal.

North London M.C.C.

Tabulated results are now to hand of the petrol consumption test held on the 9th inst. round an eighteen-mile course from Radlett:

CLASS A (Solo under 500 c.c.).—R. L. Richardson (3 Alecto) and G. Richardson (2¼ Velocette), 144 m.p.g., tied for first place.

CLASS B (Solo over 500 c.c.).—M. J. Wilkes (5 Zenith), 106 m.p.g.

CLASS C (Sidecars under 750 c.c.).—W. J. Henderson (5-6 James sc.), 76 m.p.g.

CLASS D (Sidecars over 750 c.c.).—S. Hunt (8 Matchless sc.), 49 m.p.g.

North Lindsey A.C.

Formula results of the hill-climb on the 9th inst. are now available, and are as follows:

CLASS 1 (up to 350 c.c. on Formula).

	Fig. merit.
1. Mrs. M. C. Jennison (2¼ Velocette) ...	628
2. W. Froggitt (2¾ Verus)	1114

CLASS 2 (351 c.c. to 500 c.c. on Formula).

1. L. F. Harrington (3 A.B.C.)	527
2. S. G. Jennison (3½ Sunbeam)	1002

CLASS 3 (501 c.c. to 600 c.c. on Formula.)

1. W. Brompton (4¼ B.S.A.)	1327
2. H. Taylor (4 Triumph)	1511

CLASS 4 (above 601 c.c. on Formula).

1. H. Jarvis (6 Bat)	1181
2. F. G. Howard (8 Zenith)	1213

CLASS 5 (up to 600 c.c. on Time).

1. L. F. Harrington (3 A.B.C.)	23s.
2. L. Bainton (3½ Norton)	26⅘s.

CLASS 6 (Solo, Unlimited, on Time).

1. {L. F. Harrington (3 A.B.C.) / F. G. Howard (8 Zenith)}	23s.
3. S. G. Jennison (3½ Sunbeam)	25⅗s.

CLASS 7 (Sidecars above 351 c.c. on Formula).

	Fig. merit.
1. J. Eves (4 Triumph sc.)	1496
2. J. R. Clark (5 Rudge sc.)	1863

Forty-six entrants actually faced the starter, which is an excellent result considering the bad weather.

April 28.—Taunton and District M.C. and L.C.C. Opening Run to Lyme Regis.
April 28.—Eastern Valley M.C.C. Speed-judging Contest.

A Section devoted to Club Announcements will be found on Page xlii.

Plymouth and District M.C. and L.C.C.

A very large number both of spectators and competitors attended the hill-climb at Peak Hill, near Princetown, Dartmoor. The distance measured nearly half a mile, which Lieut. Ross on a 3½ h.p. Norton negotiated in 30⅖s. M. P. Pike on a 2¼ h.p. Levis won the 300 c.c. class, and M. T. Fallon on a 7-9 h.p. Harley-Davidson and sidecar the sidecar class.

Midland Centre A.C.U.

Regulations and rules are now available for the Centre inter-team trial scheduled for April 30th. Each team will consist of seven riders, mounted on four solo and three passenger machines (sidecars or cycle cars not exceeding 8 cwt. and 1,100 c.c.), or three solo and four passenger. The performance of the best five only will be taken into account, irrespective of type. There will be several circuits, totalling 100 miles, of the one course, each rider's time on his first round, between limits of 17 and 20 m.p.h., to be his schedule speed for the remaining circuits. The trial will be non-stop throughout.

Yorkshire Centre A.C.U.

At a well-attended meeting in Leeds on April 11th, arrangements were confirmed for the Sheffield and Hallamshire Club's Centre reliability trial on May 7th.

Sheffield and Hallam M.C. and L.C.C.

The date of the annual Sheffield Traders' Team Trial is fixed for April 24th; the same course in the Stocksbridge district will be used. Three circuits of approximately twenty miles each will have to be covered, non-stop regulations throughout.

Leeds Motor Union.

Eighty sat down to tea on the occasion of the president's invitation run to Barden Towers. The weather was very favourable, and a most enjoyable day was spent in the neighbourhood of the pretty village of Burnsall.

North-western Centre A.C.U.

To find a champion to represent the centre, a trial, with Knutsford as a base, will be held on May 8th. A large entry is anticipated; and a considerable number of "qualified officials, marshals, and observers" is required in order to make the event a success.

Cheltenham M.C. and L.C.C.

About fifty members took part in the opening run, and enjoyed tea at the Swan Hotel, Bibury. After tea a very enjoyable and interesting time was spent by some members in inspecting the trout farm, while the younger element enjoyed an hour "stunting" on an adjoining bank.

Amersham, Chesham, and District M.C.C.

An interesting programme is now in course of preparation, and the opening run will take place on the first week-end following the settlement of the transport crisis. The present secretary is Mr. U. K. Goodwin, Heath House, Hyde Heath, Amersham.

Dewsbury and District M.C.C.

Held recently at Burfleet Hill, a fast and slow climb resulted as follows: Fast climb.—1, N. Kitchen (3½ Premier) and S. M. Haigh (3½ Ariel) tied, 38s.; 2, D. Flynn (4 Triumph), 40s. In the re-run, Kitchen recorded 42s. against Haigh's 46s. In the slow event the placings were the same.

Public Schools M.C.C.

Besides the winner (G. G. Gardner, on a 4 Triumph), only C. Keith Robinson (3 A.B.C.) was successful in climbing Old Chalky in the surprise competition held recently. A bad patch of deep leaf-mould "brought off" D. Crawford and W. Bishop (both on 5 Zeniths), who had surmounted the greasy portion at the bottom.

Eastbourne and District M.C.C.

By an arrangement the club met members of the Lewes Club at Five Ashes on the occasion of the opening run, and altogether proceeded to the Hand and Sceptre Hotel for lunch, where a most enjoyable time was spent by over sixty members. After lunch some of the party proceeded to Lamberhurst for tea, while the remainder went to Uckfield.

SPLIT LEGGINGS.

"I know of nothing to beat it, and it deserves to be better known."—*"Ixion" in "Motor Cycle" of 17th March in describing the "Split" Overalls.*

The suit is put on and off in a few seconds, no pulling over dirty boots, nor soiling your hands. They open right down outside of leg, and are fastened with two springs. There is absolute freedom and comfort, combined with neatness, and they are guaranteed to keep you dry under all conditions of weather. This is the only suit that kept out the terrible wet weather in the Reliability Trials at Copenhagen, when clothing was included in these trials.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns First 12 words 3/–, and 3d. for every ad- ional word. Paragraphs of under 8 words e charged double rate. Each paragraph is arged separately. Name and address must counted. Series discounts, conditions, and ecial terms to regular trade advertisers will quoted on application.

Postal Orders and Cheques sent in payment for vertisements should be made payable ____ & Co. ILIFFE & SONS Ltd., and crossed ____ easury Notes, being untraceable if lost in ansit, should not be sent as remittances.

All advertisements in this section should be companied with remittance, and be addressed the offices of "The Motor Cycle," 20, Tudor reet, London, E.C.4, or 19, Hertford Street, ventry. To ensure insertion letters should posted in time to reach the offices of "The otor Cycle," by the first post on Friday orning previous to the day of issue.

All letters relating to advertisements should ote the number which is printed at the end of ch advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical printers' errors, although every care is taken avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be lressed to numbers at "The Motor Cycle" Office. ien this is desired, the sum of 6d. to defray the cost of istration and to cover postage on replies must be added the advertisement charge, which must include the rds Box 000, c/o "The Motor Cycle." Only the number l appear in the advertisement. All replies should be lressed No. 000, c/o "Motor Cycle," 20, Tudor Street, C.4. *Replies to Box Number advertisements containing nittances should be sent by registered post, but in all such es it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box mber, as it is unusual for these to be sold without first ng inspected by the intending purchaser, advertisers will ilitate business by embodying in their advertisements me mention of the district in which the machine ered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons y deal in perfect safety by availing themselves of our posit System. If the money be deposited with "The otor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the ods is three days, and if a sale is effected we remit the ount to the seller, but, if not, we return the amount the depositor, and each party to the transaction pays rriage one way. For all transactions up to £10, a posit fee of 1/- is charged; on transactions over £10 d under £50, the fee is 2/6; over £50 and under £75, 5/-; er £75 and under £100, 7/6; and on all transactions er £100, ½ %. All deposit matters are dealt with at Tudor Street, London, E.C.4, and cheques and money lers should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an dication that the advertiser is willing to avail himself of e Deposit System. Other advertisers may be equally irous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no swer to their enquiries are requested to regard the nce as an indication that the goods advertised have eady been disposed of. Advertisers often receive so ny enquiries that it is quite impossible to reply to ch one by post.

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

Don't Scrap an old Engine,

but give it a

NEW LEASE OF LIFE

by fitting the

World-famed Philipson Pulley.

Entirely Free from troublesome and weighty complications—only two working parts—no levers, rods, wheels, etc., to worry about. Simply takes the place of the ordinary pulley. One nut secures the complete gear to the engine. Can be fitted without any alterations to most direct belt-driven engines in a few minutes.

For hill-climbing it is unsurpassed. Makes mountaineering easy.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet.

During the past few weeks the following machines have been fitted with PHILIPSON Pulley:

Easy Travel.

Not only during a transport strike, but at all times the motor bicycle provides the most pleasant, and the quickest and most economical means of transit.

This applies equally to the solo rider undertaking a business journey, and to the family bent upon a pleasure trip.

Any motor cycle purchased from us can be depended upon for good service, as our agencies for new models embrace only the best makes, and our second-hand machines are completely overhauled before being offered for sale.

Short Distance Records.

DOES racing improve the breed? Undoubtedly; provided that the means by which races are won can be rendered applicable to touring machines without detriment to reliability or comfort. Such events as the Tourist Trophy and many of the long-distance races at Brooklands have done much to improve the cooling, reliability, and general efficiency of the touring motor cycle; but what of the short-distance records? Let it be understood that we have no intention of disparaging the fine performances which have been accomplished over short distances. On the contrary, these phenomenal speeds are most interesting and instructive, and are productive of new ideals and new standards of performance. At the same time, it is evident that some of these records are of little immediate advantage to the average motor cyclist, since they are incapable of being sustained for any useful period. Provided the manufacturer of the record-breaking machine sets to work to incorporate the lessons he has learned in his touring mounts, well and good; but if he merely concentrates on obtaining an extra mile per hour on the track but little progress will be made.

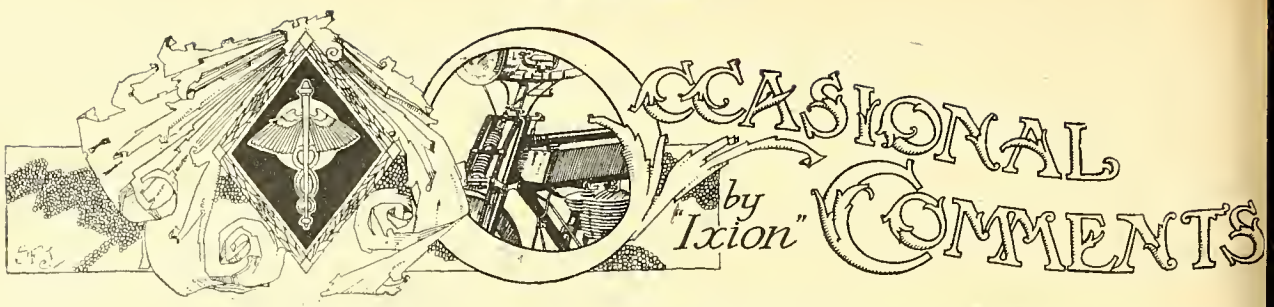
"Following the Sport on Paper."

IT is not necessary to own a motor cycle to be a motor cyclist!

Possibly the younger generation provides the greater number of non-motoring enthusiasts for the pastime, to remove the paradoxical character from our opening statement; but, as recent letters from readers have shown, there are many of more advanced years who must, perforce, be content "to follow the sport on paper." Some have been owners in the past, while others have yet to taste the actual joys of the throttle-lever. For the present, both classes gain much pleasure from anticipation and imagination.

After all, as the "real" motor cyclist will confess, one of the greatest joys is choosing the new machine. And one may *choose* without *buying*. To the motor cyclist at heart, owner or not, nothing is more interesting than to follow the improvements, developments, and performances of his favourite machine. In this, motor cycling is unlike, and is superior to, any other hobby.

A Test for Non-slip Tyres.



LAST Saturday's Midland Open Trial proved that present-day motor cycles, provided that they are suitably shod, will climb any gradient likely to be found where roads are made. Since so much, then, depends upon the tyre fitted, it would seem that in issuing results of any important trial, organisers of competitions should in future make public the particulars of the tyres fitted.

Further, the trial suggested that interesting and informative data could be obtained if a trial were organised, at a time when greasy surfaces could be depended upon, with tyre performance as its chief function.

At present, tyre manufacturers are able to announce successes of motor cycles fitted with their tyres, but little light is thrown upon the failures due to unsuitable treads. The comparatively large number of retirements in last Saturday's trial may give an erroneous impression as to the reliability of modern motor cycles, and we are constrained to remark that a very large percentage of those who did not finish failed owing to the exacting requirements of the regulations.

Those unable to make clean ascents of some of the sixteen slippery hills realised that they had lost so many marks that all hope of an award was gone, and therefore elected to watch their more lucky contemporaries. Most of the failures on the hills were due to lack of wheel adhesion, hence the necessity for some record which will guide the public in the purchase of tyres. If prospective buyers require that their machines shall be able to ascend the steepest hills, then they should be told of the importance of correct tyre selection.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Carrying Batteries.

DURING the last year or two I have made it my business to try most of the electrical equipments on the market, and experience has quite cleansed my mind of the ancient prejudice against carrying a battery which coil and accumulator ignition had burnt into the brains of most veterans. The average modern battery is quite astonishingly good. It doesn't shed its paste, or spill its electrolyte, or evaporate its charge secretly and rapidly. You can almost play football with it, if you want to, and it regards the vibration of a motor cycle at speed as a pleasant, tickly kind of massage, which merely makes it feel good. My sole criticism on the resurrection of the battery has nothing to do with the cells themselves, but rather with their minor accessories. I have experienced infinite trouble on most installations with flimsy wiring, gimcrack switches, and metal cases which were too tight a fit for their contents. The other day, for example, it took three of us an hour to get the battery out of its case. The designer would state that the battery was meant to be left alone. Doubtless. But if makers will send a machine by rail with an obvious and naked switch, the railwaymen will play with it and leave the switch on. The machine will then arrive with its cells juiceless. So we *had* to take the cells out. We have already spent much precious time trying to get them back again.

Electric Connections.

IN this particular instance the designer had obviously been obsessed by three noble ideals: he wanted to get (1) a cheap set; (2) a lightweight set; (3) a waterproof set. He therefore employed a metal battery case, with its only joint in a position where wind could not force rain to penetrate. He made it small to keep the weight down. He twisted up the ends of his wires to avoid the use of special terminals (surely an unpardonable anachronism!), and he secured his wire-ends to tiny brass screws, because there was no space for substantial binding posts. As a nett consequence I would rather tackle a 750 piece jigsaw than assemble that battery, duly wired up, into its case. When it was assembled, most of the contacts were bad, thanks to our playing pulley-hauley with the wires to make room for the battery to enter; several short circuits were created in the process, and without the aid of a Röntgen ray apparatus, it was quite impossible to tell where the shorts were, for the case was hermetically sealed when its lid was on. "No connections on the lid" should be an invariable rule. I daresay cylindrical batteries are more costly to make than the rectangular types, but the nicest case I ever owned was cylindrical, and when you lifted off the cover, every connection lay revealed. What is the objection to a rectangular case, carried in the stern prong of a double bracket, and so designed that the lid takes off without disturbing any connections? I have had this set under test for a month without getting any light out of it, and the battery has already been charged up twice at a power station, and run down as a direct result of the problems of installing it on the 'bus.

A Scrap.

WHICH would you rather handle in a scrap over British roads—a fast car or a fast motor cycle? The other day two of us had a royal dust-up across twenty miles of country, the respective mounts being a 65 m.p.h. car and a 65 m.p.h. T.T. bicycle. No, Mr. Paterfamilias, you need not address an indignant letter to the editor. We observed an unwritten law that the speeding was to be strictly reserved for such stretches of highway as were empty and safe. The contest ended when the motor cyclist exaggerated the speed at which he could round a certain bend. It turned out to be rather pot-holey, and by the time his front wheel had finished its buck-jumping, he was confronted by a sheer impossibility in the way of a steering arc. So he ran through a gate which was conveniently open at a tangent to the curve, while the car slid round the bend at speed with its brakes squealing. I will not say which of the two mounts I was on; but I am pretty certain that the car has the best of it on empty roads which are tolerably flat, but that the bicycle should win every time if the gradients are at all pronounced or if the roads are not quite empty.

Impromptu Dust-ups.

THE scrap described in the last paragraph reminded me of many a chance encounter with speed-loving strangers, encountered haphazard along the roads on all sorts of motors. Nothing is commoner than to receive a mute challenge from a rider travelling in the same direction, and these silent challenges reveal human nature at its best and at its worst. For example, one is touring on a 2 h.p. two-stroke, and runs into the dustcloud of, say, a 20 h.p. Austin, which is pottering along. You are going 5 m.p.h. faster, and hoot your way past. The driver scowls down at you, accelerates, repasses, and slows down again. Obviously a cad of the first water. Or again, you are on a T.T. Norton solo, and you sail up alongside a ditto. He glances hastily at your tank, and down goes his nose on the lamp bracket. All well and good. In a mile or two you approach a village, a nurse wheeling a pram, or an elderly woman

Ixion's "MOTOR CYCLE REMINISCENCES" have lately been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4

Occasional Comments.—

driving a frisky pony—anything which counsels a gentleman to slow down. The enemy puts over a barrage of hoots, and passes the obstacle at full throttle. You let him go rather than imitate his bad example; let him have his brag about mopping you up, and content yourself with the reflection that you have observed the courtesies of the road. But it is in a car *v.* cycle scrap that decency is most called for. I recall one such scrap years ago which began near Exeter and lasted into the London suburbs. I was a passenger in the car. Now a car should slow where a motor cycle need not, and should slow more than a motor cycle need. For two main reasons—the car makes more dust, and the car needs a wider safety clearance than a cycle. All through that prolonged scrap our unknown adversary on an I.O.M. Rudge observed the decencies of warfare. At every rational slow down he called a truce, adjusted his lead or default at the end of the slow to what it had been at the start of the slow, and then crouched and "revved" once more. We road-raced for well over 150 miles on a summer day without running any risks or making ourselves a nuisance to anybody; and no rules or regulations could have maintained fairer conditions.

Three-speed Baby Two-strokes.

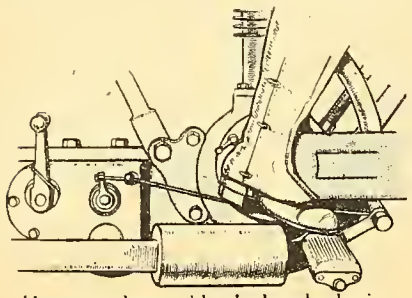
THE three-speed gear box will be just about standard on baby two-strokes within another year. I do not agree with some authorities that the average baby can stand a higher gear—I find that most "babies" soon slow down towards a crawl on longish slopes with their present top ratio. It is surely at the lower end that a two-speed box wants improvement. Either its bottom is so low that the machine cannot catch a snail when it is forced off top, or else the bottom is so high that you dare not take the 'bus into really difficult country. A three-speeded baby pleases me, because it will climb modest hills swiftly and steep hills surely. The bottom ratio of a two-speeder is always a compromise. But, Mr. Maker, do not forget to list the two-speed as an option; you know you will probably charge an extra fiver for that extra gear, and some of us cannot afford it. Production will not be affected so long as you make your gear boxes interchangeable.

The Export Trade.

A SOLDIER serving in India writes me a pathetic letter anent the struggle between patriotism and economy which tears the breast of a Britisher abroad. In his case economy has won, and he has bought a 16 h.p. Reading Standard with full electric equipment at Rs. 1,662, or say £110 at current exchange rates. He finds it a thoroughly satisfactory machine, and can criticise no detail whatever from a practical standpoint; perhaps the enamelling of the frame is not first-class, and perhaps the dynamo drive (round leather belt) would give more trouble in moist England than it does in dry India.

If his patriotism had towered above all pecuniary obstacles, he would of course have bought a British machine. The cheapest British machine on offer at the time of his letter was priced at Rs. 1,750, or say £117; but this machine was only of 3½ h.p., and its price included neither a hooter nor a lamp.

Incidentally, the entire lighting outfit of the Yankee machine, complete with lamps, is priced at forty-five dollars; the new rich alone can be patriotic at these terms.

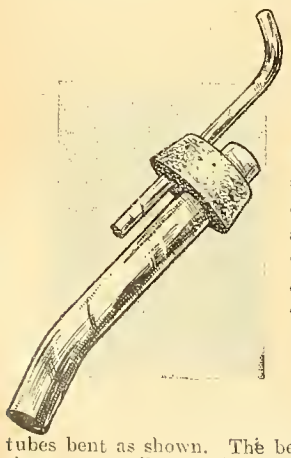


Already the trees are taking on their summer cloak of leaves and the sidecarist is prospecting picnic grounds.

IDEAS: Useful and Ingenious.

For Broken Clutch Wires.

THIS temporary method of overcoming a clutch wire breakage may interest those readers who possess machines fitted with Sturmey-Archer gear boxes. Remove the broken wire from outer

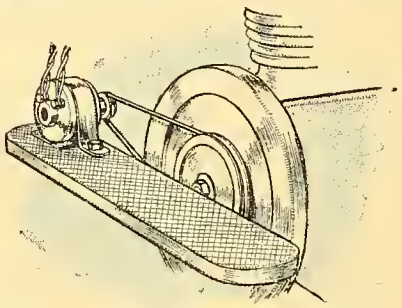


How to get home with a broken clutch wire.

sheath. Now fit nipple into the retaining slot in clutch actuating arm and thread the other end of wire through screwed adjuster. If the free end of the wire is now attached to the front footrest rod or an adjacent nut, it will be found quite easy to use the clutch by merely bearing down with the heel of one's boot on the wire—quite a small movement sufficing to disengage the clutch.—Q.E.D.

A Non-splash Tank Filler.

BENZOLE has a reputation for damaging tank enamel if allowed to overflow or splash when filling-up. Therefore the device illustrated should be of considerable benefit to users of that fuel. It consists simply of a cork to fit in the orifice of the can and two glass

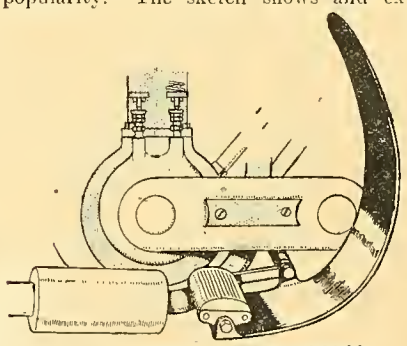


An easily made non-splash filler, consisting of a cork and two lengths of bent glass tube.

tubes bent as shown. The bending operations are easily carried out with the application of a little local heat. Naturally this filler may also be used with petrol; but it is somewhat too fragile to carry about on the machine.—G.M.

Lighting with a Miniature Dynamo for City Riding.

THE footboard of any machine with an outside flywheel is an excellent position for a small dynamo for lighting purposes, for it is usually easy to fit an extra pulley, as shown. In this case, an Alterna cycle generator was used.

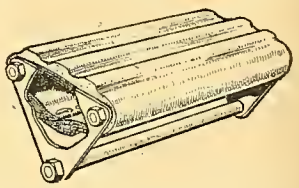


Many two-strokes readily adapt themselves to a simple form of dynamo drive such as this.

and has been converted from friction wheel to pulley drive. Beyond the fact that the dynamo is bolted down on a rubber pad to minimise vibration, the other details are made clear in the drawing.—C.T.

Simple Legshields.

LEGSHIELDS are at times worth their weight in gold, but the fact that they are often clumsy and awkward to fit prevents their more general popularity. The sketch shows and ex-

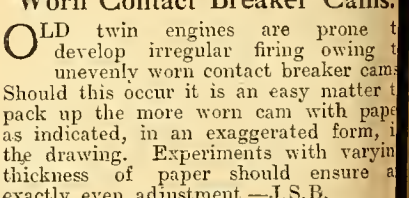


A neat fastening for a light mudshield

plains a simple idea for a legshield, which applies particularly to a Triumph. Obviously, the height to which the shields may be raised depends on the strength and weight of the metal used, since no top support is employed.—T.W.

Simply-made Footrests.

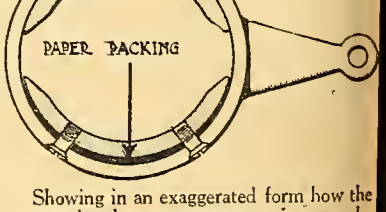
INEXPENSIVE and useful footrests may be constructed from the simplest materials if the plan illustrated be followed. Each rest is simply made of



Utilising a section of discarded tyre for constructing or re-covering footrests.

three rods and two triangular end-plates the rubber portion being a length of discarded tyre laced taut over the upper two rods.—P.F.B.

Silencing When Required.

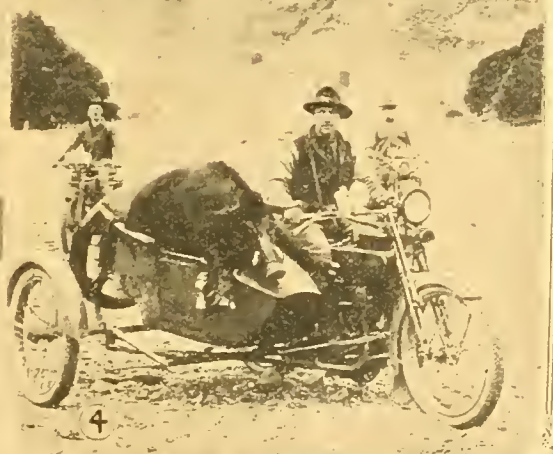


AS there are numbers of machines about nowadays fitted with open exhausts, it is rather convenient to be able to quieten the note down for town work, or passing restive animals etc. The device illustrated consists simply of a butterfly valve in the exhaust pipe.—C.H.H.

Simple baffle for long exhaust pipes.

Worn Contact Breaker Cams.

OLD twin engines are prone to develop irregular firing owing to unevenly worn contact breaker cams. Should this occur it is an easy matter to pack up the more worn cam with paper as indicated, in an exaggerated form, in the drawing. Experiments with varying thickness of paper should ensure an exactly even adjustment.—J.S.B.



Showing in an exaggerated form how the contact-breaker cams on a twin may be evened up with paper packing.

Scenes from Four Countries.

(1) Motor cyclists who have toured the Continent will be familiar with the picturesque bullock waggons which frequently caused a halt on the narrow roads. A Triumph outfit in a village of the French Alps.

(2) A pretty scene on the banks of Loch Long. In both Scotland and Wales the mountain sheep are surprisingly tame. The sidecar is an A.J.S.

(3) A pastoral scene in Warwickshire, the county of wooded lanes and old-world cottages. A Brough Superior sidecar awaits the leisure of the shepherd with his flock.

(4) A Californian scene. A Harley-Davidson bringing home the spoils of the hunt, a well grown wild boar.

Lightweights for Hard Service

In the Elan Valley near Rhayader.

Through a Big Trial on a 350 c.c. Two-stroke.

Some Random Jottings from a Pressman's Log.

FOR some time past the writer has accompanied a number of important trials on a variety of machines; the selection of the mount, however, always inclining to something of fairly high power—in most cases, indeed, a sidecar outfit being used.

Although a pressman engaged on a reliability trial may not be condemned to adhere to strict averages, his work compels him to be at a number of places *en route* at definite times. The start, lunch stop, and finish are all essential points of interest where information is to be gleaned, while the chief of the observed points must also be attended whilst the bulk of the entry pass so that the majority of performances may be seen and compared.

Qualms, at the Start.

This sort of work demands a machine at once reliable, speedy, and controllable, so that the choice of something with an ample reserve of power and seldom worked up to its capacity is a foregone conclusion. A machine which *might* fry innumerable sparking plugs on a hard blind, which *might* consume gallons and gallons of petrol, which *might* fail on every hill, and which *might* dry up on three-mile low-gear mountain crawls, would distinctly not do for the job.

Now, there are plenty of people ready to say that small air-cooled two-stroke engines will play all these disconcerting tricks, and that engines of this type over 250 c.c. may be even cursed with still greater frightfulness. Judge then the writer's alarm when, allocated to the recent Western Centre two-day trial in Wales, his own hefty single was hung up on the railway at the eleventh hour, a general transport strike was in the air, and the only machine available was a 350 c.c. two-stroke, so new that it was doubtful whether its bearings had been run in.

According to all reports the trial was to be, in the American tongue, one of the "worst ever" (it was!), and with the whole staff looking on dolorously a start was made from Coventry, with lightest possible equipment (in pockets) in readiness for running alongside and an extra two gallon tin of "juice" on the carrier just in case the strike happened and supplies for the homeward journey were stopped.

Astonishing Economy.

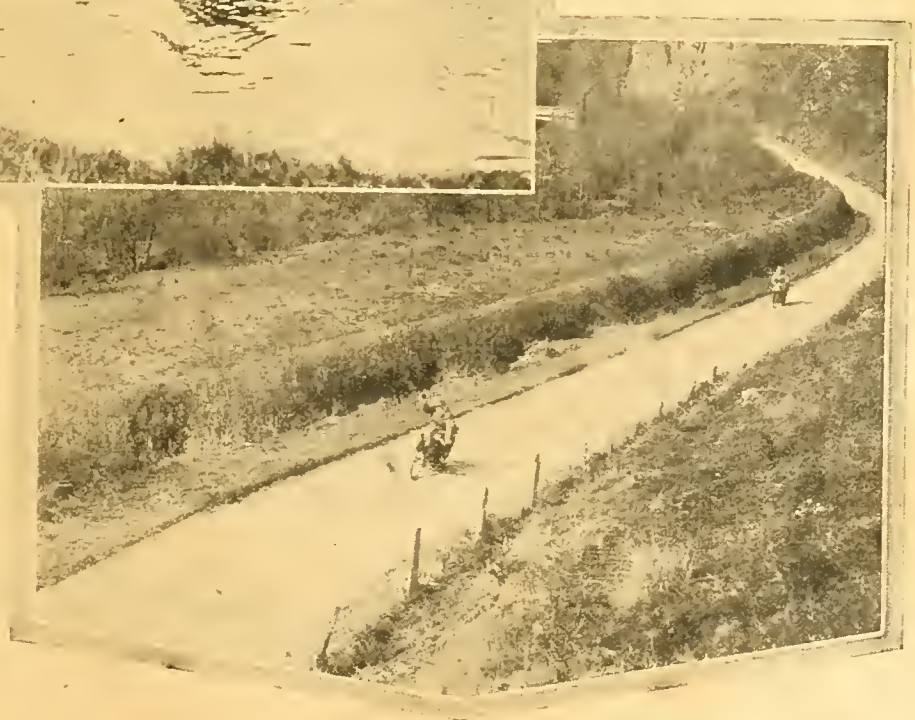
The journey from Coventry to Hereford is a good main road run of sixty-five miles, and on arrival inspection revealed that just over a half-gallon was needed to bring the spirit up to its previous level in the tank. 110 m.p.g. And a time for the journey which would not bear investigation! Surely the critics of two-strokes must be astray somewhere!

Description of the actual trial need not be given here, for it was thoroughly dealt with in the issue of April 14th. Thanks to the good petrol consumption, the spare tin on the carrier was not called upon, except to help out one or two unfortunate competitors; indeed, during the course of the two days the writer came to be known as "the gentleman with the green can," but whether the name was prompted by gratitude or irritation at his slow, wobblesome, and impeding progress on certain sections where he was determined neither to get on nor get out, despite the fact that schedule time was being lost, is not known.

Top Gear Climbing.

However, as for hill-climbing, the 350 c.c. two-stroke certainly proved its worth; on a 6½ to 1 top gear it accounted for the greater part of such hills as Caio, Stay-a-Little, Panne Hill (near Garth), and the direct Llanrhystyd-Lampeter road. In the trial itself only two two-stroke machines were really in the running, and both deserve mention for their performances; one, a 2½ h.p. Connaught, lost time, but a 350 c.c. Beardmore-Precision, driven by T. B. G. Vale, plodded along consistently, and finally came home to

Lightweights for Hard Service.—

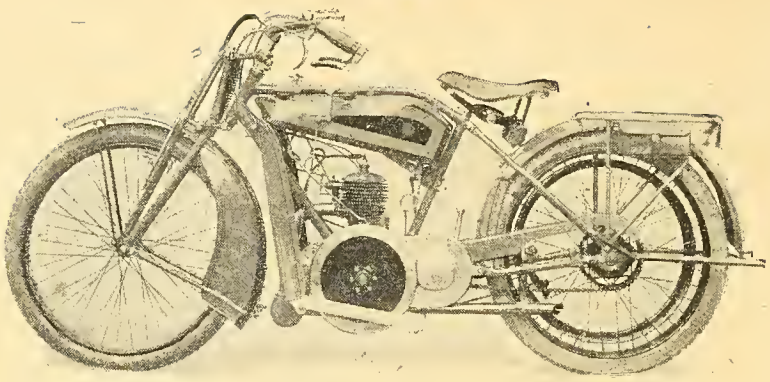


earn a "gold." Other air-cooled two-strokes in the trial fell out, it is true, but none of them apparently from causes or defects said to be peculiar to the type of engine.

Watersplash Stories.

In watersplashes (except those with footbridges!) the chain-drive fitted to our 3 h.p. Ivy (the cat is out now!) was appreciated, for it was agreed that one observed river-crossing was indeed like a certain competing camouflaged American car—a sporting Ford, but some belt-drive entrants would not see the joke.

Another amusing experience befell the writer when plugging up the apparently endless winding slope from Dyffryn Castell on the road to Llanidloes. A ten-knot breeze was blowing down from Plynlimmon, and far ahead a car could be seen proceeding slowly upwards, perhaps doing "15" on second. Slowly overhauling it at perhaps 18 m.p.h., it was alternately sighted and lost to view as the road twisted and turned, then rounding a further bend it still remained hidden, but a round object was merrily bounding down the pass; it was a hat, scudding merrily before the breeze. Instinct prompted an attempt to meet it with the front wheel, but second thoughts pictured the owner's chagrin at receiving the wreckage of a battered velour—presumably it was from the car in front. Next round the bend came a lady, running gamely, but not the most gallant of sports would have backed any fancy but the hat in that curious race. Nothing for it, brakes on hard and off the machine just as the hat went by. No joke sprinting downhill with legs stiffened by 150 miles freak trials route; can the hat be caught before it goes over the edge at the next bend? Yes! Just missed it. No! Over it goes, down the valley on the side of Y Glog (that's a mountain!) and it looks as though it will go with the wind as far as Devil's Bridge. Excellent; it was caught between Tyn-y-ffordd and Yspytty Cynfyn (notice local colour!), then a painful climb back on to the high road, where the hat was returned to grateful owner, compliments exchanged, and once more on the track of that confounded trial. It meant a really hard blind to catch up, but no plugs were "fried," and the pocketful of spares were not wanted. Fie upon the old trials rider who vowed before we left Hereford that all the plugs would be used before lunch stop on the first day!



A MODERN TRIAL—CONTRASTS IN "ROAD" CONDITIONS.

In the Western Centre trial in Wales, all kinds of roads were encountered. Here are shown two extreme samples on which time might be lost and gained respectively. The picture at the head of the article conveys an idea of the loose slaty surface peculiar to the country.

Lightweights for Hard Service.—

And there were no more incidents worth mentioning, except "adjusting" a dented back rim with a boulder as big as a 56 lb. weight—and that didn't necessitate opening the tool bags; so for purely solo riding over any sort of roads or over the top of Plynlimmon, where, as the soldier said of Sahara, "there's miles and miles of sweet nothing at all," the 350 c.c. two-stroke seems to be the very 'bus, having all the power needed, yet weighing little enough to be in no way tiring to handle.

In view of the top gear performance and lack of speed on low, however, three speeds would seem desirable.

The writer of the accompanying article found that a 350 c.c. two-stroke was capable of accomplishing a strenuous trial. This is the 3 h.p. two-speed Ivy which he used.

A TRAILER CARAVAN.

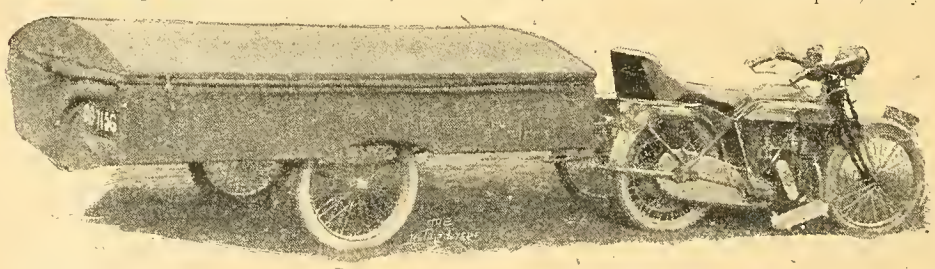
A Light Collapsible Outfit to Accommodate a Family Sidecar Party.

WHETHER it is the "cost of living" in boarding houses or a love of the open air born of experience during the war, it is a fact that camping and caravanning have become very popular of recent years. There are several excellent trailer caravans—replete with every convenience—designed for towing behind a car. There are also many self-contained motor caravans to be found in secluded glades during the summer months, but, so far, the motor cyclist interested in a holiday in the open has had to be content with a tent.

The caravan shown erected. Sleeping accommodation for two adults and two children is provided.

Mr. Archie Cocks, the Beardmore-Precision competition rider, has now introduced a trailer caravan for motor cyclists, and as the cost approximates to that of a sidecar attachment (*i.e.*, about £40), it seems to offer possibilities of which many motor cyclists may take advantage.

One's first thought on examination of the illustrations is that the weight will be a severe handicap for any but the most powerful machine, but this can be dismissed, since Mr. Cocks tows one behind a 350 c.c. Beardmore-Precision sidecar.



Long distances in a short time would not be covered with a caravan in tow—for the caravanner is an easy going individual as a rule, and as he carries his house with him he can stop to sleep wherever he pleases.

Sleeping Accommodation for Four.

The overall dimensions of this trailer caravan are 7ft. 6in. × 5ft., and when collapsed its height is about level with the back of the sidecar. With the roof raised—an operation which takes about five minutes—there is 6ft. headroom and sleeping accommodation for two adults and two children.

Two hinged upholstered beds are fitted, which in the day-time form seats on each side, and four folding legs support the body. As will be seen, there are two celluloid windows, and the back flap can be adjusted to any desired opening.

The outfit is far from being merely a tent on wheels. The "top" is constructed of durable hood material, so the weather "bogey," which so often deters would-be campers, may be dismissed.

Following "car campers'" practice, we have now a motor cycle trailer that holds the complete camping equipment. This is one of a fleet that will soon be available for hire in North Wales.

Arrangements are in hand whereby a fleet of these caravans will be available for hire in Wales—a project which may appeal to those who wish to experience the joys of motor cycle caravanning before investing in one for themselves. Mr. Cocks's address is Clwydfa, Aberdovey, N. Wales.

OVERSEAS SECTION

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

British Motor Cycles Popular.

THE undoubted popularity of British motor cycles Overseas, and, everything considered, the satisfactory export figures for the past year, go to show the possibilities of motor cycling abroad. Our foreign mail bag each week echoes the preference for British machines in every market. Quality must come first in out-of-the-way corners of the world where so much depends upon reliability, and our manufacturers are adopting the right policy in refusing to export motor cycles built to a price.

What is being done, however, is only a small percentage of what could be done if British manufacturers gave the same attention to Overseas riders as to those nearer home.

An impression after perusing the many letters we receive from our distant readers, is that it is not uncommon for these riders on the frontiers of the Empire to ask themselves whether British manufacturers are doing everything in their power to encourage Overseas trade. An oft reiterated complaint is that manufacturers constantly omit to mention prices in their announcements.

A reader in Nigeria supports other correspondents whose complaints on this score have been published in our "Letters to the Editor," and points out that in places like Nigeria a motor cyclist interested in an article has to wait perhaps ten weeks to obtain a quotation. On receipt of this it may be another two weeks before there is an outgoing mail, and then a further ten weeks or more to obtain delivery. By this time the need for the article may have passed. In any case, one can appreciate the tendency to be apathetic regarding anything the delivery of which may be fully six months ahead.

We presume our correspondent is referring to accessories, but, in any case, it seems to be a point well worth the consideration of those who would foster Overseas trade.

Many are the difficulties of manufacturers catering for Overseas motor cyclists, and "trade" opinion seems to be divided as to whose wishes are to be fulfilled—the rider's or the agent's. At the present time, no doubt, sales departments are chiefly interested in the man to whom they sell their goods, *i.e.*, the trader, leaving it to that individual to interest the rider. Conditions vary so much in different countries that it is impossible to make a rule applying to all, but the opinion is prevalent that the particular requirements of the thousands of keen motor cyclists scattered Overseas wherever roads of any kind exist do not receive the detailed consideration that their numbers merit.

There also appears to be a tendency for manufacturers to resign themselves to the present unfavourable rates of exchange, and to wait until they improve. We have recently met Overseas buyers who maintain that prices of complete motor cycles abroad could be made more favourable if they were decided by the manufacturer instead of by the agent. This, of course, is a matter for the industry to decide and,

33 M.P.H. FOR 9½ HOURS OVER COLONIAL ROADS.

The finish of the recent race from Durban to Ladysmith and back, held by the Natal M.C.C. On a 7-9 h.p. Harley-Davidson and sidecar, C. C. Smith covered the course of 310 miles in 9h. 36m.—a good performance considering the nature of the course. P. Flook, a former winner, again won the solo class on a 2¾ h.p. Douglas.

Overseas Section.—

after all, those with the most at stake should be better able to fix a policy than the onlooker.

Another Overseas reader firmly asserts that most of the export business comes automatically to manufacturers without very great effort to themselves, the reputations gained in the home country and the keenness of the rider abroad to follow British events being responsible. If greater efforts were made to bring British motor cycles before the notice of motor cyclists and potential motor cyclists in the Dominions and Colonies—our correspondent affirms that there would shortly be at least two to every one British motor cycle at present in use. The manufacturer is directly in touch with the riders of his product in this country, and it is thought that a good purpose would be served abroad by permanent or periodical direct representation.

A Selection of Letters from Readers scattered all over the World.

Spring Frames for Desert Work.

Writing from Mesopotamia, LIEUT. C. P. GUISE suggests the fork girder position for the licence holder. In this respect he has anticipated popular fancy in this country. Continuing, he says :

"I brought a 4 h.p. Coulson B three-speed out to this country with me, and find the spring frame wonderful for cross-desert work. The engine, of course, is magnificent as regards smooth running. Only when the engine is up against a stiff pull does it thump like the ordinary four-stroke single.

"I take in *The Motor Cycle* each week, and it helps to pass no end of dull hours."

A Comprehensive Ideal.

MR. E. H. PRESTON THOMAS, New Zealand, writes : "As I was unable to visit Olympia, your Show Number was of exceptional interest to me. There seem to be a great number of useful fitments on the new machines, but very few of them have a great many improvements. I have amused myself by making out a list of the different components I should like to have fitted on my 'ideal' motor cycle.

"ENGINE.—4½ h.p. horizontal twin, as in Humber.

"GEAR BOX.—Ariel type ; change speed lever as on 4 h.p. Douglas.

"CARBURETTER.—Automatic, one lever.

"MAGNETO.—Lucas Magdyno.

"TRANSMISSION.—All-chain, in oil bath, as on Sunbeam.

"BRAKES.—As on A.B.C.

"CYLINDER HEADS.—Detachable.

"TAPPETS AND VALVE SPRINGS.—Enclosed.

"SILENCER.—Largest possible.

"SHOCK ABSORBER.—On engine-shaft sprocket.

"LUBRICATION.—Mechanical.

"KICK STARTER.—With exhaust valve release cam, as on Matchless.

"WHEELS.—Interchangeable, including sidecar wheel.

"TYRES.—Dunlop 28×3in.

"FRAME.—Back part Raleigh springing, front as on A.B.C.

"STANDS.—Front, as on B.S.A. ; back, as on Sheffield-Henderson.

"HANDLE-BARS.—As on Bat-Jap.

"TANK.—Round, as on N.U.T. or Bat.

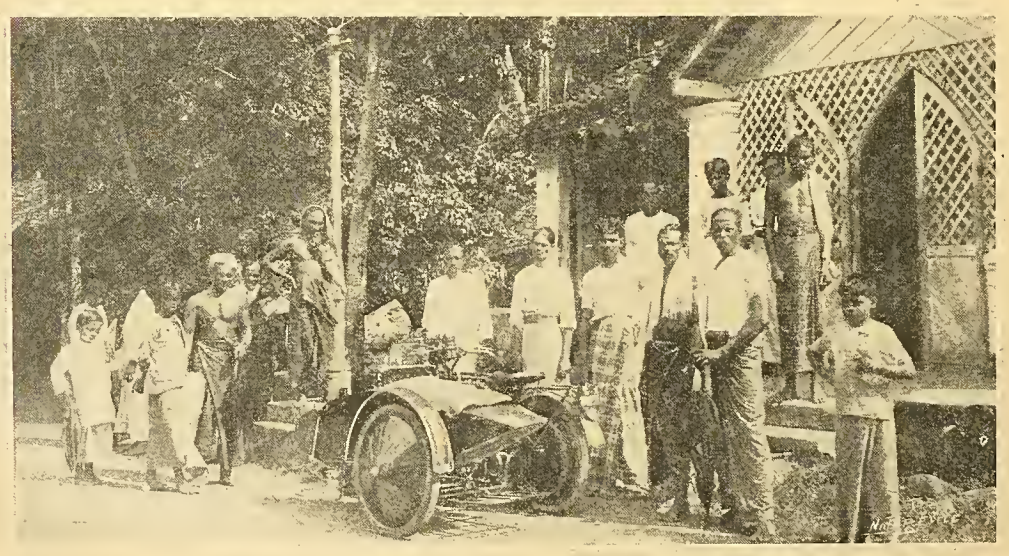
"TOOLBAG.—As on Zenith.

"UNDERSHIELDS.—As on Cedos, to turn up in front of footboards.

"MUDGUARDS.—As on 6 h.p. B.S.A. ; back guard to have bottom shield like front one, and to be jointed for easy tyre repair, as on Abingdon King Dick.

"SPEEDOMETER.—To drive direct from gear box.

"SIDECAR.—Bulbous back, to open from outside, box under car for golf clubs, mudguard on side of body, not on chassis ; screen as on A.J.S. sidecar.



"GROUND CLEARANCE.—Not less than six inches.

"I am an ordinary rider, with an hour or two at odd times during which I can ride ; hence my insistence on good mudguarding. It is very irritating, after a few miles' run in a shower of rain, to have to spend an hour or so cleaning one's machine."

Holiday-making in the Sahara Desert!

That there might be worse places for motor cycles than Algeria is the opinion of Mr. G. N. BELL. But fancy spending one's holidays in the Sahara! He writes :

"The number of motor cyclists in this country is very small, and my friend Mr. Lester and myself came quite a sensation in the interior when out touring on our B.S.A.'s. It is marvellous what surfaces a motor cycle will stand up to. This holiday we have been out into the Sahara Desert, for a distance of 300 kilometres, and without a hitch, too. The only English machines available here are B.S.A. and Triumph, so choice is very limited. The French machines, in my opinion, are almost useless for hard work. I have owned two previously and discarded them with disgust. Roads are very good all along the coast districts, but a bit rough as one goes inland, and eventually dwindle away to mule tracks. If some of your crack 'six days' men did a few of the stunts we perform sometimes they would consider the A.C.U. event an amusement only!"

It would be easy to inscribe this photograph as illustrating the interest that the native population of Ceylon take in a modern sidecar outfit. It is too obvious, however, that the native gentlemen are more interested in the photographer than the sidecar. The building in the background is a petrol station on the main Kandy-Colombo road, and the machine an 8 h.p. Zenith, regarding which its owner, Mr. K. de B. Smart, who sends us the picture, expresses great satisfaction.

T.T NOTES AND NEWS.

This Year may Prove the Vexed Question—Side-by-Side versus O.H.V. Engines. Rumours of Remarkable Speeds.

IN seven weeks' time the T.T. races will have been won and lost. Small wonder that the engine experts are now having a busy time.

* * * * * * *

As is usual, there is an atmosphere of mystery surrounding the experimental departments of most of the firms who are vieing with each other for the Blue Riband of the motor cycle world.

* * * * * * *

Over a hundred entries have already been received by the Auto Cycle Union, and it is not at all improbable that the list will close with an extra twenty-five.

* * * * * * *

Never has such secrecy been exhibited by manufacturers in regard to T.T. machines, and particularly engines. Most of the large entry have their plans well forward, but few definite T.T. designs are available for review.

* * * * * * *

Those who were disappointed that the lessons of the war were not discernible in last year's T.T. will have no cause to complain this year, we fancy. Four-valve engines, cylinders of cast iron and steel, and some with aluminium shroudings are in preparation.

* * * * * * *

The Motor Cycle has been privileged to inspect several very advanced T.T. designs, but no details can be divulged at present, without committing a breach of confidence.

* * * * * * *

Many applications have already been received from agents all over the country for *The Motor Cycle* service of Tourist Trophy telegrams. Interest in this year's event, according to custom, promises to far outstrip the remarkable interest in the Blue Riband event of former years.

* * * * * * *

One regrets that the event will not have a truly international character. One hoped to see a team of Swiss riders on the latest that M.A.G. can produce. An Italian team was also expected.

* * * * * * *

A number of firms have already been over the course in the Isle of Man, in order to try out the engines in preparation for *the* event.

The Nortons will be standard machines, and as road-worthiness is as important as super-speeds, they should have a good chance. That is not saying that Nortons are not fast—they are probably the speediest mounts obtainable by the public to-day.

* * * * * * *

A day or so ago G. E. Stanley was at Brooklands with the prospective Triumph T.T. riders, and our track correspondent intimates that the new 500 c.c. Triumph machines are remarkably fleet.

* * * * * * *

To encourage the development of lightweight motor bicycles, a valuable silver cup (to be won outright) is again offered by *The Motor Cycle* to the winner of the 250 c.c. class in the Junior T.T. Race. Last year, R. O. Clark, riding a 250 c.c. two-stroke Levis, won our award.

* * * * * * *

Last year, it was possible fairly accurately to forecast the winners. This year, however, there are several "dark horses" embodying much that has been learned by aero engine designers during the war.

* * * * * * *

As to whether the scientifically perfect engine will beat the type evolved from practice remains to be seen. Certain it is that some o.h.v. engines are not proving their superiority over the side-by-side types. The o.h.v. Jap, for one, does not appear to have come up to expectations, and it has been practically decided that the side-by-side valve system will be adopted for the races.

* * * * * * *

In the meantime several riders have been over to the Island, and as a result there are the usual rumours of men who have broken all lap records in the early hours of the morning, notwithstanding the necessity to open gates on the mountain section.

* * * * * * *

Every keen rider will be sorry if the new Bradshaw oil-cooled engine is not represented in the T.T. From all reports there is doubt on this score at the moment, for, apparently, a positive drive is necessary with so powerful an engine. Belts, it was discovered last year—ask Duggie Alexander!—have a limit.

T.T. Notes and News—

The B.S.A. Co. has had a full year in which to experiment, as the machines entered were designed for last year's event, but withdrawn in view of the fact that it was appreciated that a racer cannot be produced in a day. From all accounts they are exceedingly fast, and are of the o.h.v. type.

* * * * * *

The Rover, too, have something "especially fast." Of late years the Rover name has not been associated with speed events, but results of recent experiments leave little doubt that the new racing Rovers will give a good account of themselves.

* * * * * *

The Velocette designers are busy on their T.T. machine, which will be ridden by George Denley, while the Levis is reputed to have a good chance for the 250 c.c. class award with a 65 m.p.h. machine.

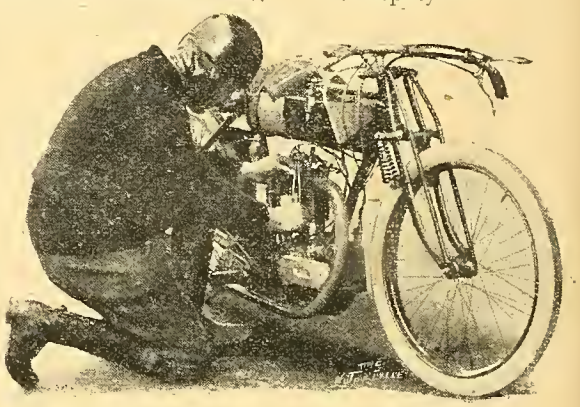
* * * * * *

Indian T.T. machines are already in this country, and they are reputed to be even faster than last year, when insufficient time was available for them to be tuned up.

* * * * * *

Recent performances—and last year's T.T.—bring the o.h.v. A.J.S. and the Sunbeams among the prime favourites, while the new o.h.v. Douglas mounts are not to be overlooked.

* * * * * *



Last year the 350 c.c. Blackburne came near to winning the Junior event—finishing second and third. This year it will have an overhead valve engine—one has already appeared at Brooklands.

* * * * * *

Coventry does not intend to allow Birmingham and Wolverhampton to have all the honours as last year. The racing Triumphs are among the "dark horses," and, despite the veil that has been over his activities in recent years, Stanley is still a potentiality to be watched.

* * * * * *

An agent who has entered the T.T. now finds that he will not be able to ride. The machine will be in readiness, and the entry has been made and fee paid, and there is an opportunity for an ambitious rider with the necessary qualifications to take his place. Arrangements can be made for the free use of the manufacturer's garage and tuning shop in the Isle of Man, and the only expense to which the rider would be put would be personal hotel expenses. Letters to the Editor on this subject should be marked clearly in left hand corner of the cover, "T.T. Deputy."

PRELIMINARY TUNING FOR THE T.T.

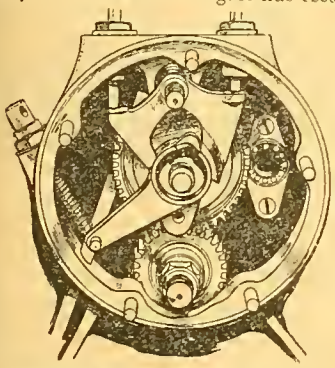
Following up their success in last year's T.T., Messrs. Burney and Blackburne have produced a new o.h.v. engine for the Junior event. Here is shown E. Remington, of the Blackburne staff, "tuning" the machine at Brooklands.

A "Mystery" Mount at Brooklands.

The Lighter Side of a Serious Matter.

MOST people think that the professional racing motor cyclist spends his time laboriously tuning an engine to obtain colossal speeds, practising with that engine, or setting out long and complicated mathematics involving all the powers of calculus in search of the reason for things.

In reality the life has its lighter moments. Take, for example, a matter which even now convulses the trade. A certain firm, having an eye to the Tourist Trophy, has two engines, one the product of scientists, the other of its own racing man. Of these engines one is so secret that the employees go about saying "hush," and walking tip-toe in felt slippers. Both engines recently were taken out for a track trial. Now, certain unbelievers, rivals and humorists combined, no sooner learned of the arrival of this new engine than they laid plans to find out all about it. True, the machines to which the engines were fitted were taken to the far side of the track accompanied by draughtsmen, highbrows, mathematicians, and experts with water cooled slide rules, to say nothing of *the* racing rider and another of his kin to ride the "Hush" machine.



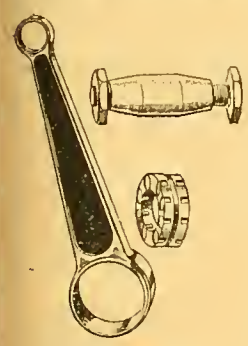
Suddenly the roar of an exhaust broke the stillness of the air. Never before had such a crackling note been heard. Then every blade of grass seemed to hide a peering figure, while the morning air resounded to the click of stop watches. This effectually prevented a full-power trial and somewhat annoyed the works staff. But worse was in store, for machines of rival-makes appeared suddenly from the paddock and their riders, making speed, attempted to get level with the "Hush" machine in order to obtain a glimpse of the engine and its special features. This was defeated, for no sooner did one of the inquisitive range alongside than the new machine was pulled up, leaving the others to career at 70 m.p.h. into the blue. Then came one limping along on a racing motor cycle with a tyre flat—flat, so 'tis said, because its valve had been unscrewed—the rider came to the side, stopped and walked towards the secret lair, piteously soliciting the loan of a pump. Instantly the staff ranged in a thick group around the jealously guarded engine, so this came to naught. But the tests were not final, so the position of both sides is "as you were." Once again silence reigned at Brooklands, broken only by the murmurs at rival conferences.

Further humour is added to a situation already funny, because after all this, the professional racing rider eased his soul of its pent-up feeling to the assembled and delighted populace. Meantime the staff chased press photographers who kept occurring, accidental-like, near the "Hush, Hush."

J.A.P. ENGINES FOR THE T.T.

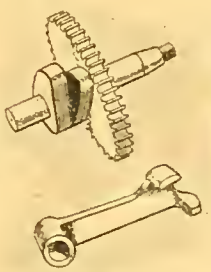
Improvements in Engine-cooling and Valve Mechanism.

FOR the T.T. races the brains of the technical department of Messrs. J. A. Prestwich and Co. are pinning their faith to what are practically standard engines with side-by-side valves. Not that the overhead valve engine has escaped their attention, but the winning of a road race needs more than sheer speed. The credit of the making of the fastest lap avails the rider but little if his mount is no stayer; and it is consistent running *combined with speed* which wins the race.



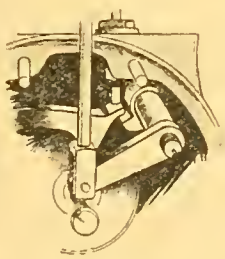
Simplicity is the keynote in the design of the 2½ h.p. J.A.P. engine timing gear.

For the Junior event there is a 70×90 mm. (346 c.c.) single with an entirely new valve gear, the valves themselves being of exceptionally generous dimensions.



Adequate cooling is assured by the size of the radiating fins. A new position has been found for the sparking plug behind the engine and at a slight angle to its horizontal plane. This has been proved by experiment to give better results than the more conventional location, and also to eliminate pre-ignition. A really bad plug, which refused to give any satisfaction at all in the inlet cap, ran for 10m. 32s. in the new position, and allowed the little 2¾ h.p. engine to develop 7.75 h.p.

Quite the most remarkable feature of the engine, however, is the simplicity of the timing gear. There are only two gear wheels, the larger of which carries the inlet and exhaust valve cams. The small gear wheel on the main shaft is mounted on a taper and held by a key, but has three keyways so spaced that a fine adjustment, equal to a variation of one-third of a tooth, may be obtained if desired. The tappets are adjustable, and the valve guides are a push fit in the cylinder, while experiments are being made towards the adequate lubrication of the valve stems, which has always been a difficult problem.



There is a ball bearing on the pulley side of the engine, while the connecting rod has double roller bearings so as to reduce friction to a minimum. The gudgeon pin is a press fit in the aluminium piston, and is prevented from scoring the cylinder by means of brass caps.

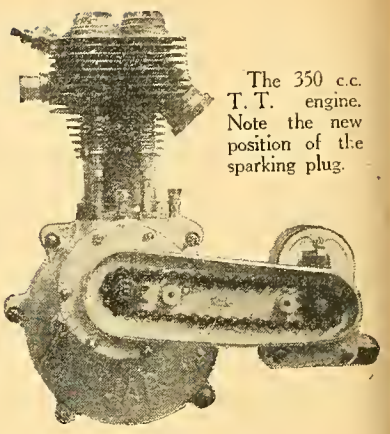
centre of the timing case, which, incidentally, is of malleable iron on this unit.

This little engine should have a good chance in the 250 c.c. class for *The Motor Cycle* Trophy, which, last year, was won by a two-stroke.

It must be distinctly understood that the T.T. engines described are intended only for these races, and will not yet be available to the general public.



J.A.P. Engines for the T.T.—

One engine we saw which will not figure in the T.T. is worthy of mention, as it shows the up-to-date methods of the experimental department, which is in charge of an expert who, as well as being thorough, scientific, and modern in his research, is also a well-known rider. This was a six-valve twin with two exhaust and one inlet valve in each cylinder. The exhausts were actuated by double-fingered rockers; a detachable head was fitted, surmounted by a ribbed aluminium cap so as to aid cooling. Like all J.A.P. twin engines, it had the cylinders set at an angle of 50°.

The new timing gear of the 2¾ h.p. J.A.P.

On the occasion of our visit, we were particularly impressed with the thoroughness displayed in the experimental department, whose chief had devised, among other things, a special machine for testing the firing angle of magnetos, and had disclosed faults in the design of more than one magneto of well-known make. Every engine sent in for repair is tested under power and has to drive a fan, which also directs a cooling blast on the cylinder walls.

The 350 c.c. T. T. engine. Note the new position of the sparking plug.

B.M.C.R.C. REVISES ITS RULES.

Sidecar Passengers Defined. Thirty Yards Limit for Assistance in Starting. Brakes must be Fitted in Races.

THE British Motor Cycle Racing Club, which is, of course, the leading motor cycle racing organisation in Great Britain, has now compiled a set of racing rules, some of which are distinctly novel.

For the first time a passenger is defined as a person of not less than sixteen years of age, and weighing not less than 132 lb. Any divergence in weight may be made up by the use of ballast.

A Register of Engines.

A new rule is to the effect that every entrant must state on his entry form the club register number of the engine of the motor cycle which he desires to enter, and the name of the person who is to drive it. The object of this rule is to prevent, as has happened in the past, unknown riders being entered on special racing machines belonging to well-known competitors, perhaps so as to obtain favourable betting odds or a better handicap.

The entry in the register must state the bore and stroke of the engine and such other particulars as may be required. Every engine so registered will carry its club registered number sealed to the cylinder, and alterations in the dimensions or any other particular of any engine as entered on the register would render the entry void. No motor cycle having the engine so altered can take part in any competition until application has been made for re-registration.

Brakes on Racing Mounts.

Readers will remember the controversy which reigned last autumn over the question of the fitting of brakes to racing motor cycles; and the new B.M.C.R.C. rules make it obligatory that every motor cycle taking part in any race other than an attempt on record must have an efficient rear wheel brake.

Throughout a race the motor cycle must be propelled by its own power, and competitors may not pedal, paddle, or push at any time, except a competitor whose motor cycle is disabled before the finish of any race may by his own unaided muscular energy get his motor cycle across the finishing line, and will then be considered to have completed the race.

In all sidecar races a passenger must at all times keep his body from the hips down within the body of the sidecar, and his head and shoulders must be exposed and visible from the judges' box.

It is quite evident that these carefully-drawn-up rules will do much to protect the interests of competitors.

PRICES OF SECOND-HAND MOTOR CYCLES.

A Schedule of Prices at which used and shop-soiled Motor Cycles were being offered in the miscellaneous advertisements of last week's issue of "The Motor Cycle."

Comparative Motor Cycle Performances.

A Paper read before the I.A.E. on a Subject of Interest to all Motor Cyclists.

(Continued from page 501.)

In fig. 15 are curves for a 350 c.c. two-cycle engine of popular make. The horse-power curve A was issued by the manufacturers in their advertising matter.

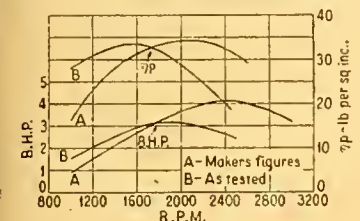

FIG. 15.—350 c.c. TWO-CYCLE ENGINE. Power curves.

The author was not surprised to find that the engine was not really as bad as it was painted by its makers, for test of one which had done a thousand or so miles gave the results plotted in curves B in fig. 15. As a matter of fact, the early speed droop on the B curves is probably due in part to the fact that the engine was tested in the condition in which it finished its road work.

A few interesting figures are obtainable as a result of analysis of various speed performances, an assumed value being taken for the tractive resistance, on the basis of the figures given in Table III. For example, the record-breaking 7-9 h.p. Indian which, ridden by Le Vack, recently did 95 m.p.h. on a declared gear of $3\frac{1}{16}$ to 1, must have been producing an ηp of 91 lb. per sq. in. at 3,500 r.p.m. —an excellent figure for a side-valve engine, but not at all abnormal. The $3\frac{1}{2}$ h.p. Norton, with O'Donovan up, did 83 m.p.h. on a gear of $3\frac{1}{16}$ to 1, which means an ηp of 99 lb. per sq. in. at 4,000 r.p.m. A $2\frac{3}{4}$ h.p. Douglas, with overhead valves and steel cylinders (pre-war type), was stated to give a maximum of 13 h.p. at 5,000 r.p.m., which means 96.5 lb. per sq. in. ηp at that speed. A $3\frac{1}{2}$ h.p. Sunbeam, giving $14\frac{1}{2}$ b.h.p. maximum at 4,250 r.p.m., shows 89 lb. per sq. in. These figures, of course, are not the maximums for ηp, since the maximum horse-power is not reached until the mean effective pressure has fallen off considerably.

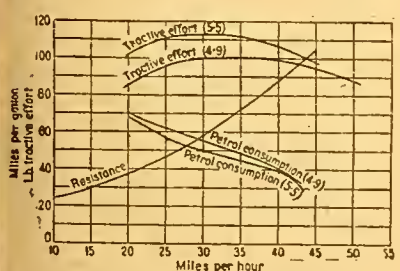

FIG. 16.—6 H.P. B.S.A. OUTFIT.
Tractive effort and resistance curves
No windscreen fitted.
Gross weight, 950 lb.
$R = 20 + 0.042v^2$.
Gear ratio, 4.9 to 1 and 5.5 to 1.
Maximum speed by curves = 42¾ m.p.h. (4.9).
" " observed = 43 m.p.h.
T.E. curve obtained from engine test.
B.S.A. carburetter.

To take a different type of engine, a $3\frac{3}{4}$ h.p. Scott was recently clocked at 69 m.p.h. Assuming the revolutions to be 2,500 per minute, which is a reasonable figure for a two-cycle engine, the brake mean effective pressure would be 48 lb. per sq. in. on the gross volume, or 60 lb. per sq. in. on the nett volume, assuming the latter to be 80% of the gross. On the other hand, the pre-war Singer machine, which for a considerable time held the hour record in the 350 c.c. class at 62.68 m.p.h., was geared $4\frac{7}{8}$ to 1, and was, therefore, doing substantially 4,000 r.p.m. for the whole hour. This gives an ηp of only 71 lb. per sq. in.

Lastly, the little $2\frac{3}{4}$ h.p. A.J.S., which has made such sensational sprint performances, is said to give $13\frac{1}{2}$ h.p. on the brake. Unfortunately, the author has no idea of the speed at which this is developed, so it can only be said that if the speed is 5,000 r.p.m., the ηp is 100 lb. per sq. in.; if 4,500 r.p.m., 112 lb. per sq. in.; or if 4,000 r.p.m., it is 125 lb. per sq. in. In any case the figures are remarkable enough.

Road Performance.

In fig. 16 the power curve given in fig. 12 for a 6 h.p. B.S.A. engine has been converted into tractive effort curves, assuming the top gear ratios of 4.9 and 5.5 to 1, which are the extremes of the range fitted by the B.S.A. Co. as standard. The tractive resistance curve is also shown, and it will be observed that this cuts the Te curve for the 4.9 gear at $42\frac{3}{4}$ m.p.h., and for the 5.5 gear at $43\frac{3}{4}$ m.p.h. These speeds, as a matter of fact, agree almost exactly with the author's observations on the road. Lest it be thought that this particular combination is unusually slow, it may be as well to point out that it can only attain a maximum possible speed of 44 m.p.h., for, at this speed, the resistance horse-power is exactly equal to the maximum horse-power produced by the engine. To give this, a gear of 6 to 1 is required if no wheel slip is allowed for, so that in all probability 5.5 to 1 is about the fastest possible gear on the road.

The Harley-Davidson engine, the power curve for which is given in fig. 11, with its maximum of substantially 18 h.p. at 3,100 r.p.m., would do just 51 m.p.h. against the same resistance, and would need to be geared 5 to 1. Since it is improbable that any ordinary touring engine produces more power than this example of the Harley-Davidson, it may fairly be said that 50 m.p.h. is about the upper limit of speed for a fully equipped touring combination with large sidecar and screen. Reduction of the v^2 factor in the resistance formula will, of course, increase the maximum possible speed very considerably.

To return to fig. 16, the lower curves represent the probable petrol consumption of the B.S.A. 6 h.p. combination at various road speeds, as calculated from the bench tests and the tractive resistance curves. It will be noticed that the higher gear gives an advantage of about 5 m.p.g. over most of the range, although at the upper and lower limits the difference is not so great. These consumption curves, which agree very well with road results, show the immense importance of keeping the speed low if petrol economy is an object, since, while the consumption may be 68 m.p.g. at a steady 20 m.p.h., it increases to 50 m.p.g. with an increase of speed to 30 m.p.h., and to 39 m.p.g. if the speed be increased to 40 m.p.h.

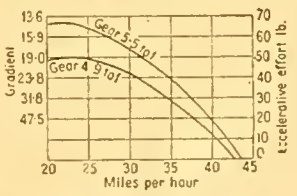

FIG. 17.—6 H.P. B.S.A. OUTFIT.
Acceleration and climbing capacity.
Gross weight, 950 lb.
Curves obtained from T.E. curves.

The liveliness and climbing power of the machine are obviously represented by the space between the Te and Tr curves, and fig. 17 shows this on a horizontal base. The ordinates to the curves in fig. 17 represent the excess tractive effort available at the speeds concerned, and, therefore, represent the accelerative effort or climbing capacity of the vehicle at each speed. The considerable advantage gained by the use of the lower of the two gear ratios is at once evident. On the 4.9 gear, a steady gradient of 1 in 19 can just be climbed, while on the 5.5 gear the maximum is 1 in 14.2—a very great improvement, which more than outweighs the slight increase in petrol consumption.

The tractive effort curves on all three gears of the same combination are given in fig. 18, together with the resistance curves on various gradients. The maximum gradient climbable on top gear is, of course, 1 in 14.2, as shown in fig. 17,

Comparative Motor Cycle Performances.—

while on the second gear 1 in 8 is just possible, and on the first gear something steeper than 1 in 4 is covered. It will be noticed that if maximum climbing speed is desired, it pays to change down from the top to the second gear at 30 m.p.h., and from the second to the first gear at about 20 m.p.h.

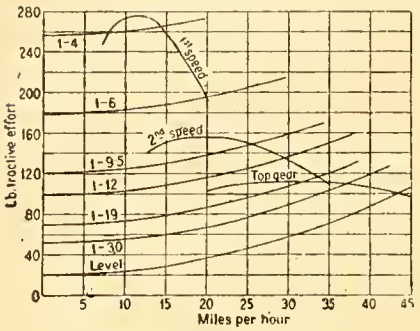

FIG. 18.—6 H.P. OUTFIT.
Tractive effort and resistance curves.
Gear ratios, 5.5, 8.5, and 13 to 1.
Gross weight, 950 lb.
$R = 20 + 0.042v^2$.

The performance of the 4½ h.p. B.S.A. combination on all gears is described graphically in fig. 19. The curves are plotted to show what the author calls the accelerative ratio on the three gears of 5.5, 8.8, and 14 to 1 respectively at all road speeds. The accelerative ratio is merely the accelerative force of fig. 17 divided by the gross weight of the machine.

Since the maximum accelerative ratio on top gear in fig. 19 is approximately 0.08, the maximum gradient climbable is 1 in 12½, while as the curve cuts the zero line at 43 m.p.h. this is obviously the maximum speed. The second gear capacity is just short of 1 in 6, while on the first gear 1 in 3.2 is possible.

The same machine solo is described by fig. 20, in which the full line curves represent the performance of the machine on gear ratios of 4.75, 7.6, and 12.2 to 1 respectively, the gross weight being

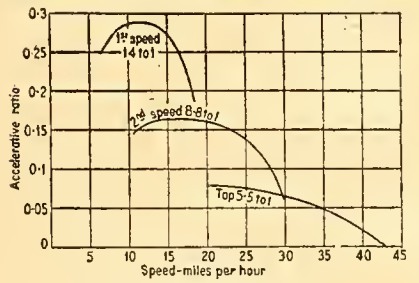

FIG. 19.—4¼ h.p. B.S.A. OUTFIT.
Acceleration curves.
Gross weight, 780 lb.

taken to be 440 lb., and the rider presumed to be sitting bolt upright in the conventional, but decidedly uncomfortable, touring position. The power curve used is the full line in fig. 14, which represents the results obtained from the standard engine.

Returning to the top gear curves, the dotted curve represents exactly the same machine with the gear raised to 4 to 1, and the rider adopting a semi-T.T. position. The chain curve is for the top gear performance of the high compression engine of which the power curve is given in fig. 14, with the rider in a full racing position and a gear ratio of 3¾ to 1.

Car v. Motor Cycle.

Taking first the engine, the motor cycle engine is, as a rule, of a somewhat lower compression ratio than the average car engine, and its ideal ηp is, therefore, correspondingly lower, while its ideal consumption is a trifle higher. In making comparisons, therefore, it is necessary to allow for this difference in compression ratio, and for this purpose the author has prepared the curves in fig. 21, which show the variation of ideal ηp and consumption with varying ratios of compression. These curves are based on Ricardo's proposed standard of attainable ideal efficiencies, and, while their exact accuracy may be of a doubtful order, their shape is certainly sufficiently nearly correct for purposes of comparison. From page 121 in the same volume the author has extracted particulars of a

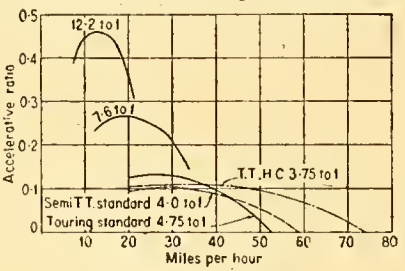

FIG. 20.—4¼ H.P. B.S.A. (solo).
Acceleration curves.
Gross weight, 440 lb.

number of car engines, as given in Table IV. At the bottom are given figures for certain of the motor cycle engines already mentioned :

TABLE IV.

Engine.	R.	Actual ηp. lb. per sq. in.	Ideal ηp. lb. per sq. in.	%
20 Daimler	4.6	88.7	118	75.0
6–30 Daimler	4.6	90.7	118	77.0
4–30 Daimler	4.5	87.8	117	75.0
6–45 Daimler	4.5	87.5	117	74.8
16–20 Napier	4.5	83.0	117	71.0
A Wolseley	4.1	77.0	112	68.8
C Wolseley	4.1	81.0	112	72.3
M Wolseley	4.1	79.0	112	70.5
20 Vauxhall	4.5	85.0	117	72.6
20 Vauxhall PH ..	5.0	104.0	121	86.0
25 Vauxhall PH ..	4.5	90.0	117	77.0
4½ B.S.A. standard	3.52	83.0	103	80.5
4½ B.S.A. HC	4.0	93.0	110	84.5
6 B.S.A. standard	3.6	82.0	105	78.0
8 Harley-Davidson	3.7	83.0	106	78.0

It will be seen from these figures that motor cyclists have no need to be ashamed of the performance of their engines. The motor cycle engines quoted are by no means of special design; yet their performance is better than that of any car engine in the list except the 20 h.p. Prince Henry Vauxhall, which was a special high efficiency engine.

A comparison of petrol consumptions is more difficult, since the author has not the data respecting the performance of car engines to enable a real comparison to be made. One example may, however, be taken. In Mr. Pomeroy's last paper*

* See Proc. I.A.E., Vol. XIII., p. 163.

a large number of petrol consumption figures were given, the best result obtained on the standard side-valve engine being 0.71 pint per brake horse-power per hour. This engine has a compression ratio of 4.8 to 1, its ideal consumption from fig. 21 being 0.54 pint. The actual is, therefore, 1.32 times the ideal. The 6 h.p. B.S.A., on the other hand, has a compression ratio of 3.6 to 1, and its ideal consumption is, therefore, 0.63 pint against an actual consumption of 0.78 pint per brake horse-power per

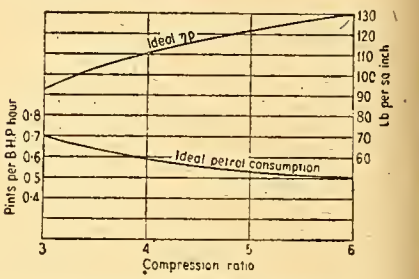

FIG. 21.—RICARDO'S IDEAL ENGINE PERFORMANCE.
See Proc. I.A.E., Vol. XIII., page 120.

hour at the most economical point. The actual in this case is, therefore, 1.24 times the ideal. The 4¼ h.p. B.S.A. gives 0.8 pint against an ideal of 0.635, or a ratio of 1.26, while with a hot air pipe fitted the consumption actually falls to 0.7 pint per brake horse-power per hour, which is only 1.1. times the ideal.

From these few figures it does not appear that the petrol consumption of the motor cycle engine is other than good.

Ton m.p.g. Comparisons Wrong.

The reason for the failure of the ton-miles per gallon system as a basis of comparison is surely obvious. It is quite useless to compare the performance of different types of vehicles on a standard which acknowledges weight only, when the deciding factor in the resistance to motion is not the weight at all, but the wind resistance. Until, therefore, a formula is devised which will incorporate the v^2 resistance factor as a basis of comparison, the only reasonable method of making a comparison between dissimilar vehicles is that which the author has already used.

THE BELGIAN MOTOR CYCLE GRAND PRIX.

THERE appears to have been a rumour in Belgium that the Belgian Motor Cycle Grand Prix will not take place. This, however, does not seem to be the case, and several Belgian agents and makers have announced their willingness to take part. Among the makes may be mentioned the Spring (an interesting machine described in *The Motor Cycle* in our report of the Belgian Show in December), the Saroléa, and Indian (the Indian agent talks of securing the services of Le Vack and an English rider). The well-known Belgian agent, M. Taymans, hopes to enter several Triumphs. Another Belgian agent, M. Breslau, expects to enter three Nortons, while the M.A.G., Blackburne, and F.N. motor cycles will also be represented.

In the Traffic.

Some Notes on Driving for the Less Experienced Motor Cyclist.

MOTOR cyclists as a whole may be divided into three classes: those who learn to drive and become first-rate riders by the constant use of their brains, those who learn by bitter experience, and others who find it difficult to learn at all.

The first can motor cycle anywhere, are not obtrusive, and do not inconvenience or endanger other people, on or off the road. The second class are willing folk, but, through their own fault, often have a crowd around them at unfortunate times. The third class, however, are to be seen and known anywhere, because their very faults and habits make them conspicuous.

Any man of wisdom can see that road and traffic conditions are vastly more complicated than ten years ago, and that things generally are, so to speak, speeded up a very great deal. A motorist in Piccadilly in 1911 suddenly brought through the space of time to Piccadilly in 1921 would be amazed at the growth and hustle in traffic, although a person who had motored continuously through that period and had kept his eyes open probably would be equally aware of the change.

What to Avoid.

The beginner wants to avoid, at all costs, any early tendency or habit in driving which may spoil his chances of becoming a good rider, and some instances of what "not to do" in riding, etc., may be helpful in exposing obvious, and yet not uncommon, errors, and dissuade him from degenerating into the third class alluded to.
